"This last step in the development of the organization of the Dennison Manufacturing Company makes the company a true industrial partnership. The ultimate control of the policies of the company is in the hands of all managerial employees, while an important share of the internal management of the company is in the hands of the employees who are not doing work of a managerial nature. Investors in the company do not share in the management, and are given a fixed rate of interest in place of a share in the profits. Two-thirds of the net profits of the company are distributed in proportion to their salaries among the managerial employees because they are the most influential in the creation of profits; and the other third is distributed in proportion to their length of service among those of the remaining employees who have been long enough with the company to become thoroughly a part of it. Each person who has become a Dennison employee is thus a true partner in the business, sharing in the ownership of its capital and with a share in its profits and in its management proportionate to the influence which his position gives him on the earning of profits and the experience which his job gives him in solving the problems of management."

THE DENNISON EMPLOYEE INDUSTRIAL PARTNERSHIP PLAN

Before March 15 of each year, the Board of Directors shall set aside as the Employee Industrial Partnership Fund, one-third of the total fund to be distributed as extra remuneration in stock in that year.

Under this provision the employees will have for their share one-half of the sum which the Managerial Industrial Partners will receive. Every employee, therefore, can feel certain that in every year in which there are any profits available for such distribution, a one-third share of these profits will be distributed among the employees. The amount of profits which the employees will get will thus depend upon the amount of profits earned and this in turn will depend upon the mutual efforts and co-operation of the employees and the management.

DENNISON EMPLOYEE INDUSTRIAL PARTNERS

Every employee of the Dennison Manufacturing Company and its subsidiary companies, who on the first day of any year has completed two years of **continuous** full-time service with the company, is eighteen years of age or over, and is not participating in the profits of that year upon some other basis, shall become an Employee Industrial Partner, and shall be notified thereof before February 1st of that year.

If any Employee Industrial Partner resigns or is discharged from the employ of the company, his rights as an Employee Industrial Partner shall immediately be suspended. If he subsequently returns to the employ of the company his rights as an Employee Industrial Partner shall be restored as soon as he has completed on the first day of any year since his return, one year of **continuous** full-time service with the company.

BASIS OF DISTRIBUTION OF THE EMPLOYEE INDUSTRIAL PARTNERSHIP FUND

The Employee Industrial Partnership Fund of any year shall by March 15 of the following year, be distributed among the employees who were Employee Industrial Partners on January 1 of the year for which distribution is made. All such Employee Industrial Partners shall be classified into six groups on the basis of length of **accumulated** full-time service as indicated in the following table. The individual members of each group who have worked the full year shall each receive a uniform sum which shall bear the ratios to the sums received by the individual members of each of the other groups that are also indicated in the following table.

Group	Term of Full-time Service on Jan. 1 of the year for which distribution is made	Index numbers or "points" indicating relative amounts received by the individual members of each of the several groups
1	Less than 5 years	10 points
2	5 years to 10 years	12 "
3	10 " " 15 "	15 "
4	15 " " 20 "	18 "
5	20 " " 25 "	21 "
6	25 " and over	24 "

No Employee Industrial Partner shall participate in the distribution of any year whose full time service or whose full time service and sick leave in that year do not amount to at least six months. If he is entitled to share but has worked less than one year, he shall receive a share proportionate to the number of full months actually worked.

Any Employee Industrial Partner who leaves the employ of the company after six months service, but before the end of the year, shall be given a certificate indicating the number of months of service for which he is entitled to share, and his share shall be sent to him at his last known address.

COMPUTATION OF LENGTH OF SERVICE

Length of full-time service shall be computed as follows:

1. Vacations and other absences not exceeding the rate of 24 working days in one year,

holidays, lay-offs of one week or less in duration if caused by unemployment, and absences of less than one working day shall not be deducted from length of service, but all other absences from work shall be deducted.*

2. The service of home workers and such other employees as do not normally work the full standard hours of their particular class of work shall not be counted.

3. Time shall be computed in full months only (and for this purpose a month shall be considered as having 25 working days), and any fraction of a month remaining at the end of a year shall be disregarded.

4. Only absences which constitute resignation or discharge shall be considered as interrupting **continuous** service.

5. In computing **accumulated** service, the service of any Employee Industrial Partner prior to the day on which he became an Employee Industrial Partner shall be counted as two years and no more, except as provided in paragraph 6 of this section; and the service of an Employee Industrial Partner whose rights have been suspended, between the date of suspension and the day on which his rights as an Employee Industrial Partner were restored, shall be counted as one year and no more.

6. In determining length of service in years prior to 1920 the lengths of service used for the purpose of distributing the 75th Anniversary Fund shall be employed and shall not be subject to amendment. Service prior to 1920 shall always be included in computing **accumulated** service, but shall not be included in computing the two years of **continuous** service necessary for a person who was not in the employ of the company on January 1, 1920, to qualify as an Employee Industrial Partner.

FORM OF DISTRIBUTION OF EMPLOYEE INDUSTRIAL PARTNERSHIP FUND

The Employee Industrial Partnership Fund shall be distributed in the form of non-transferable, non-voting stock, to be known as Dennison Employee Industrial Partnership Stock. This stock shall be issued at par in shares of $10 par value. It shall pay dividends annually at the same rate that dividends are paid on Managerial Industrial Partnership stock during the same year.

In so far as possible the share of each employee shall be distributed in certificates of Employee Industrial Partnership Stock, but such amounts (less than $10) as may remain shall be distributed in cash. Each Employee Industrial Partner at the time of first receiving a certificate shall sign a contract for special remuneration in which he shall indicate the beneficiary to whom the benefits accruing to his stock shall be paid in case of his death, and may also designate a second and third alternate beneficiary. The beneficiaries, however, may be changed by the employee at any time by notice in writing to the company.

Each former Managerial Industrial Partner who has ceased to participate in profits on that basis and has become an Employee Industrial Partner shall at the time of making this change be given the option of having his Managerial Industrial Partnership Stock exchanged for Second Preferred Stock or for Employees' Industrial Partnership Stock of equal par value.

TERMINATION OF EMPLOYMENT

Whenever a holder of the Dennison Employee Industrial Partnership Stock resigns or is discharged from the employ of the company (whether he receives a pension or otherwise) or dies, his right to dividends upon this stock shall cease, and he or his beneficiary shall return the stock to the company. In return the company shall issue to him or in case of his death directly to the first of the beneficiaries that he has designated who is living at the time of his death (and not to his estate unless no beneficiary is named or living), one share of Second Preferred Stock for every 10 shares of Employee Industrial Partnership Stock which he returned or to which he was entitled, and shall pay in cash at par for any additional shares of Employee Industrial Partnership Stock (less than 10) then remaining.

COMMITTEE ON OPERATION

The Chairman of the General Works Committee and the Chairman of the Central Committee, ex-officio, shall be a Committee on Operation for the Employee Industrial

* The regular Saturday morning working period is considered as a full working day.

Partnership Plan. It shall be the duty of this committee to investigate the operation of this plan for the purpose of determining whether it is being carried out in every particular, and to report annually to the General Works Committee concerning its operation. To this end, the Committee shall at all times have power to inspect the books and records of the company.

It shall also be the duty of this committee to prepare according to the provisions of this plan the list of Dennison Employee Industrial Partners for each year, designating the group to which each employee belongs. In case any employee is not satisfied with his position in this list or feels that he is unjustly excluded, he may take his case up directly with the Committee on Operation, which shall reconsider his case. For the purpose of such reconsideration, but for no other purpose, the President of the Company, shall, ex-officio, be a member of the Committee on Operation. The decision of this committee upon any such reconsidered case shall be final and not subject to alteration by the General Works Committee or the management.

DISTRIBUTION AND WAGES

The funds distributed are an award of extra efforts, saving of waste, and whole-hearted co-operation, and are entirely distinct from and in addition to regular wages, and the fact that funds are so distributed among the employees shall not be considered in determining regular wage rates.

SEARS, ROEBUCK AND CO.—The Sears, Roebuck and Co.'s plan for an Employes' Savings and Profit-sharing Pension Fund follows.

SEARS, ROEBUCK AND CO.'S EMPLOYES' SAVINGS AND PROFIT SHARING PENSION FUND

ARTICLE I—PURPOSE

In order that employes may share in the profits of this business, and to encourage the habit of saving, the Company has decided to contribute annually to the fund known as Sears, Roebuck and Co.'s Employes' Savings and Profit Sharing Pension Fund, a sum equal to one-third (1/3) of the remainder of its net earnings for the year, after deducting from its net earnings for such year all dividends payable during such year on its outstanding preferred stock, and a sum equal to ten (10%) per cent of the aggregate par value of its outstanding common stock, but before deducting Federal income taxes, provided, however, that the minimum amount to be contributed by the Company shall be equal to seven (7%) per cent of its net earnings for such year, without deductions for any dividends or for Federal income taxes, as shown by the annual audit of its books.

It is intended that this plan will furnish to those who remain in the employ of the Company until they reach the age when they retire from active service, a sum sufficient to provide for them thereafter, and that even those who achieve a long service record, but who may not remain with the Company all of their business life, will have accumulated a substantial sum. This Savings and Profit Sharing Pension Fund will enable an employe to secure an income for himself after the close of his active business career or, in case of his death, for his family.

ARTICLE II—ELIGIBILITY

Participation will be entirely voluntary.

Only employes who are on the payroll of the Company's Chicago, Philadelphia, Dallas or Seattle stores, or New York office, shall be eligible to participate in this fund, and every such employe who has completed one year of service, shall be eligible to participate in this fund so long as he remains such employe.

ARTICLE III—CONTRIBUTIONS TO THE FUND

An employe in order to participate must deposit in the fund five per cent of his salary. The Company will contribute a sum equal to one-third (1/3) of the remainder of its net earnings for the year, after deducting from its net earnings for such year all dividends payable during such year on its outstanding preferred stock, and a sum equal to ten (10%) per cent of the aggregate par value of its outstanding common stock, but before deducting

Federal income taxes, provided, however, that the minimum amount to be contributed by the Company shall be equal to seven (7%) per cent of its net earnings for such year, without deductions for any dividends or for Federal income taxes, as shown by the annual audit of its books.

Article IV—PARTICIPATION IN THE PROFITS

The contributions of the Company will be made annually as soon after the first of each year as an audit of the books will permit. For the purpose of participation by the depositors in the contributions of the Company, the depositors will be deemed to be divided into three groups as follows: Group A—Consisting of depositors who have been in the service of the Company for less than five years; Group B—Consisting of depositors who have been in the service of the Company for five years and less than ten years; and, Group C—Consisting of depositors who have been in the service of the Company for ten years or more. The contributions of the Company when made will be credited pro rata to the depositors respectively, based upon their respective deposits during the preceding year, except, that the participation of depositors in Group B shall be based upon one and one-half times their respective deposits during the preceding year, and that the participation of depositors in Group C shall be based on twice their respective deposits during the preceding year.

Article V—WITHDRAWALS

Sec. 1. A depositor who has completed ten years of service will be entitled to withdraw all money and securities credited to his account, including the Company's contributions, as hereinafter provided.

Sec. 2. A depositor who has not completed ten years of service will be entitled to withdraw only the amount he has deposited in cash, plus interest at five per cent per annum, compounded semi-annually, and no more; except in the case of a woman depositor who, after five years' service, leaves to become married, in which case she will be entitled to her full share in the fund, in money and securities credited to her account, including the portion contributed by the Company; and except in the case of the death of a depositor while in the service of the Company, in which case his estate, or such beneficiaries as he may designate, will be entitled to the full amount credited, in money and securities, including the contributions of the Company, as hereinafter provided; and except that whenever a depositor is dismissed from service by the Company before completing ten years of service, and the Company by one of its officers shall certify in writing to the Board of Trustees that such dismissal was not by reason of any unsatisfactory conduct on the part of such depositor, then such depositor will be entitled to his full share of the Fund in money and securities credited to his account, including the portion contributed by the Company.

Sec. 3. A depositor shall withdraw upon ceasing to be an employe of the Company, or upon failing to regularly make his deposit.

Sec. 4. A depositor who once withdraws cannot re-enter the fund.

Sec. 5. In any case of withdrawal where a depositor is entitled to share in the contributions of the Company, he will receive either (a) the full amount to his credit, as shown by the accounting for the preceding year, plus interest at the rate of five per cent per annum and plus such sums as the depositor may have deposited since December 31st of the preceding year, with interest at five per cent per annum, or (b) his full pro rata share of the securities and uninvested moneys of the fund, at the option of the Trustees.

Sec. 6. Loans will be made to depositors in cases of actual necessity and when in the opinion of the Trustees the circumstances warrant it.

Sec. 7. Any employe who has been a depositor for ten (10) full years may, if he desires, withdraw in cash, such sum or sums from time to time as shall not in the aggregate exceed one-half (½) of his share of the contributions of the Company made for the year or years subsequent to the time that he shall have been a depositor for ten (10) full years.

Sec. 8. Sears, Roebuck and Company, at the termination of the year 1923, discontinued the giving of so-called "anniversary checks." Everyone who would have received an anniversary check in the year 1924 is given the privilege (until he shall have been a depositor for ten (10) full years) to withdraw in cash from his share of the Company's contribution a sum equal to the amount of the anniversary check which he would have received in the year 1924.

ARTICLE VI—MANAGEMENT

Sec. 1. The fund will be handled, entrusted, and invested under the direction of a Board of five Trustees, to be selected by the Board of Directors of the Company, three to be officers or directors and two employes (not officers or directors) of Sears, Roebuck and Co.

Sec. 2. It is intended that so far as practicable and advisable the fund will be invested in shares of stock of Sears, Roebuck and Co., to the end that the depositors may, in the largest measure possible, share in the earnings of the Company.

Sec. 3. The Board of Trustees may from time to time, adopt rules to carry out the purposes of this plan, and may adopt amendments to the plan; but no change shall be made in the plan as above outlined unless the same is ratified by the vote of a majority of the depositors. All questions of interpretation of this plan, or amendments thereto, or the rules pertaining thereto, or relating to any matter of accounting, values, profits, or any other matters or differences which may arise shall be determined solely by the Board of Trustees, and the decision of the Board shall be final and conclusive upon all concerned.

ARTICLE VII—DISCONTINUANCE

The fund may be discontinued at any time by announcement of the Company made at least six months before its final yearly contribution. After such announcement no new depositors will be eligible to join, and upon the payment into the fund of such final contribution, the fund shall be distributed among all the depositors pro rata in proportion to their interests as ascertained by the Board of Trustees.

UNITED STATES STEEL CORPORATION.—The offer of stock on January 4, 1923, to employees of the United States Steel Corporation is reprinted below.

UNITED STATES STEEL CORPORATION

TO THE OFFICERS AND EMPLOYES OF THE UNITED STATES STEEL CORPORATION AND OF ITS SUBSIDIARY COMPANIES:

The Corporation again offers to those now actually in the employ of the Corporation, or any of its subsidiaries, the opportunity to subscribe for shares of its Common stock, not exceeding an aggregate total of 60,000 shares, under the following terms and conditions:

First—All subscriptions shall be made upon the express condition and agreement that all questions concerning the said subscriptions, and the allotments and interests thereunder, shall be decided by the Finance Committee of the United States Steel Corporation in its discretion and such decision shall be final and conclusive upon all parties.

Second—Subscriptions will not be received from employes under lawful age unless through a lawfully constituted guardian and in that case all subsequent dealings will be with the guardian until the subscriber arrives at lawful age.

Third—Subscriptions shall be for one or more shares of Common stock at the subscription price, $107.00 per share.

Fourth—The following table shows the maximum number of shares which may be subscribed for by employes whose salaries or wages are within the respective limits stated, but employes at their option may subscribe for less than such maximum number of shares.

SUBSCRIPTIONS TO COMMON STOCK

Employes Receiving Annual Salaries of:		May subscribe for a Maximum Number of:
$ 1,070.00 or less		1 share
1,070.01 to $ 1,783.33		2 shares
1,783.34 "	2,496.66	3 "
2,496.67 "	4,012.50	4 "
4,012.51 "	4,904.16	5 "
4,904.17 "	6,955.00	6 "
6,955.01 "	8,025.00	7 "

18,056.26	"	19,393.75	14 "
19,393.76	"	33,170.00	15 "
33,170.01	"	35,310.00	16 "

PAYMENT FOR STOCK

Fifth—Payment of subscriptions shall be in monthly installments to be deducted from the salary or wages of the subscriber. The first deduction will be made from March salary or wages. No installment shall be less than $2.00 per share and shall not exceed one-quarter of any one month's salary or wages. Installments exceeding the minimum must be in even dollars. Payment for the stock should be completed within three years. Interest at 5% per annum will be charged on deferred payments.

DIVIDEND

Sixth—Until payment of the subscription has been completed, any dividends paid on the stock subscribed for will be credited to the account of the subscriber as part of his payment. After the stock is issued to the subscriber future dividends will go direct to him.

CANCELLATIONS—REFUND OF INSTALLMENTS

Seventh—Subscriptions will be cancelled for the following reasons:

(1) By request of subscriber;
(2) By (a) voluntarily leaving the service, or (b) being discharged for cause, or (c) failing to resume employment when requested. (See Section Twelfth.)
(3) By discontinuing payments without the consent of the Corporation for three consecutive months.

The cancellation of a subscription forfeits all interest and benefits which the subscriber would have received if he had continued such subscription. There will then be returned to him the full amount of payments made on the subscription so cancelled with interest at 5% per annum, no credit being given him for dividends or for the special allowance referred to in third paragraph of Section Eighth, and no interest being charged on deferred payments. A subscription may not be cancelled in part, but any open account may be cancelled and payments continue on any remaining open accounts. Payments on any one subscription cannot be deferred in favor of others, without cancelling the former. Minimum payments must be made on all open accounts to avoid cancellation, except as otherwise provided.

SPECIAL BENEFITS

Eighth—When the stock is fully paid for, it will be issued in the name of the subscriber. He may sell his certificate, but as an inducement for him to keep it while he remains in the service, the following offer is made, viz.:

If he will keep the stock and in January of each year, for five years, commencing with January, 1924, will exhibit the certificate to the Treasurer of his company, together with a statement from a proper official that he has been continuously in the employ of the Corporation or of one or another of its subsidiary companies since the date of his subscription for the stock and during the preceding year, and has shown a proper interest in its welfare and progress, he will for each of such five years receive a cash payment at the rate of $5.00 a share for each share of Common stock.

Subscribers who may not have fully paid their subscriptions by January in any year, will, if their subscriptions are still in force, and they have otherwise fulfilled all the conditions of continuous and faithful service as provided, be credited in their subscription accounts with the foregoing special allowance of $5.00 per share on their subscriptions for Common stock.

ADDITIONAL COMPENSATION

Ninth—If a subscriber keeps his certificate and remains continuously in the service for five years, the Corporation intends that he shall then receive a still further compensation.

which cannot now be ascertained or stated, but which will be derived from the following sources, viz.:

The special allowances referred to in Section Eighth, which, after a subscription is fully paid, are forfeited by:

(a) Transfer of certificate from name of a subscriber, whether intentionally or otherwise;

(b) Voluntarily leaving the service, or being discharged for cause, or failing to resume employment when requested (see Section Twelfth)

will be paid by the Corporation into a special fund at the end of each year. This fund will be credited with interest at 5% per annum and at the end of the five years' period the total amount thus accumulated will be divided into as many parts as shall be equal to the number of shares of Common stock subscribed for hereunder and then remaining in the hands of subscribers who shall have continued in such employ for the whole five years. The Corporation will then by its own final determination in its discretion award to each subscriber whom it shall find deserving thereof as many parts of such accumulated fund as he shall be entitled to on basis of the number of shares then held by him under this plan.

DEATH, PERMANENT DISABILITY OR PENSIONING

Tenth—If a subscriber dies, is permanently disabled or pensioned while rendering faithful service during such five years' period, payment will be made to his estate or to him, as follows:

(a) If his subscription is fully paid and he has received and not disposed of his certificate of stock, the Corporation will pay a sum equal to $5.00 per share for each of the five years not then expired, and also a pro rata amount of the special fund arising from forfeitures, referred to in Section Ninth preceding, which may have accrued at the time of his death, disability or pensioning.

(b) If his subscription has not been paid in full, the Corporation will pay (unless, if pensioned, he elects to continue payment on the stock as provided in final paragraph of this section) the money theretofore paid in by him on account, together with the dividends paid on the stock subscribed for, the special allowance for the entire five years' period and a pro rata share of the amount of the special fund mentioned, less interest at 5% per annum on deferred installments.

(c) If at time of decease, permanent disablement or pensioning the subscription has been fully paid but certificate not yet delivered, the Corporation will turn over the certificate as first stated above, together with the additional payments mentioned in paragraph (a) preceding.

A pensioner will not be permitted to subscribe, but any subscriber who is subsequently pensioned may continue payments on his subscription, and when fully paid he will receive the certificate for the stock subscribed for and the payments referred to in paragraph (a) above.

BENEFICIARY

Eleventh—A subscriber may name in his subscription as beneficiary the person to whom in the event of his death he desires the Corporation to pay all amounts, in connection with his subscription, which would otherwise be payable to his estate. By written notice delivered to the Treasurer of the Company by which he is employed he may substitute another beneficiary. The Corporation, upon satisfactory proof of death, will, under the conditions of the subscription, pay to such beneficiary all amounts in connection with the subscription which would otherwise be payable to the estate of the subscriber. When the beneficiary has been named the subscriber's estate shall have no claim to any such amounts, unless the beneficiary should die before the subscriber, and in that event payment will be made to the subscriber's estate.

SUSPENSION OF EMPLOYMENT

Twelfth—Subscribers whose employment has been suspended by reason of the temporary closing of a plant, or a reduction in its operation, and who shall continue ready and willing when required to resume their service, will not be deprived of the special allowance of $5.00 per share per year, during such suspension, although they may have accepted

employment during such suspension. As presumptive evidence of willingness to resume employment, the Corporation will accept (1) from the holders of fully-paid subscriptions, the exhibition of the original certificate in January of each year, and (2) from the holders of partly-paid subscriptions, the retention by them of their subscription during the preceding year.

The above period of suspension will not be counted as part of the three years limited for the full payment of the subscriptions, and during such suspension monthly payments will not be required, though if so desired by the employe they may be continued.

In case of the death during such suspension of any such subscribing and continuing employe, his estate or his beneficiary will be entitled to the same benefits accruing to his subscription as if he had died while under employment.

Failure to present the original certificate as provided, or the withdrawal of a partly-paid subscription, or the failure to resume employment when requested, will constitute a relinquishment of all benefits referred to in this circular.

If a plant or office is permanently abandoned and a subscriber at such plant or office does not continue in the service at another plant or office of the Corporation or a subsidiary company, settlement of his subscription accounts will be made as provided in case of pensioned employes, Section Tenth.

Thirteenth—Subscriptions will be received until February 5, 1923, and allotment made as soon thereafter as possible.

THE STUDEBAKER CORPORATION.—The co-operative plans of the Studebaker Corporation are reproduced below.

THE STUDEBAKER CORPORATION

ANNIVERSARY CHECK PLAN

1. Continuous service is necessary to entitle employees to receive anniversary checks although absence of thirty days or less, due to sickness, vacations, suspension of operations, or leave of absences, will not be regarded as interruption of continuous service. Absences without leave, aggregating six full working days or more in employees' anniversary year, will operate as a rupture of continuous service. Employees who have been absent in the war service will not, thereby, affect their continuous service record.

2. Employees will receive anniversary checks on each anniversary date of their employment, based on their total earnings for the previous year, at the following rates per cent:

On the First anniversary	5%
On the Second anniversary	5%
On the Third anniversary	5%
On the Fourth anniversary	5%
On the Fifth and each succeeding anniversary	10%

3. Employees who resign or are dismissed, or who, with or without cause, cease to continue in the service, will not receive anniversary checks for the fractional year of service, from the date of the commencement of service, or the last anniversary.

STOCK PURCHASE PLAN

1. At one or more appointed times during each year, the Corporation will offer to its employees the privilege of subscribing to the purchase of a fixed number of shares of its common stock. This privilege will be restricted to employees who have been in the service of the Corporation for three months or more, and to individual subscriptions aggregating in any one anniversary year an amount not exceeding Three Hundred Dollars ($300.00) in purchase price, and not exceeding 20% of employees' annual rate of earnings. The announcement of each offering will specify the number of shares open to subscription, the period during which subscriptions will be received, and the price at which stock will be sold. The price will be approximately the current market value of the stock. As soon as possible after the closing of subscriptions, allotments will be made, and subscribing employees will be notified of the number of shares assigned to them. In the event of over-subscription, the corporation reserves the right to make allotments to subscribing employees of less than their individual subscriptions, on such a basis as it may deem to be fair and equitable.

2. Within fifteen days of the allotment of shares and announcement thereof, subscribing

employees shall be required to make an initial payment, in cash, amounting to 10% of the purchase price. The remaining 90% thereof will be payable in equal monthly installments of 3% of the purchase price, commencing one month from date of initial payment. Interest will be charged semi-annually, at the rate of 6% per annum, on unpaid balance of employee's account. All cash dividends and stock dividends will be credited to the accounts of subscribing employees, and the excess of dividend credits over interest charges will act as a reduction in the amount of the final payment to be made by employees.

3. Each employee, upon making his initial payment, will receive a Participating Certificate identified with the shares of stock which the corporation has purchased for his account under this plan. If he remains continuously in the service of the corporation, as herein defined, and meets, when due, his obligations in respect to his subscription for purchase of stock, this Participating Certificate shall entitle him to special reward for continuous service, consisting of an additional credit of one-half of the credit for cash dividends, if any, on the shares of stock held by the corporation for him. These credits shall continue to be made until the purchase of his stock is completed and stock certificates are delivered to him.

4. When stock certificates are delivered to employee, the numbers and identity thereof shall be endorsed upon employee's Participating Certificate. If he remains in the continuous service of the corporation, and owns and holds, without interruption, the stock purchased by him under this plan, his Participating Certificate shall entitle him to receive, in cash, from time to time as cash dividends are paid on his common stock, the special reward for continuous service described in the preceding paragraph. The agreement by the corporation to pay the special rewards for continuous service, as specified in this paragraph, is made for one year only, and any continuation thereof is subject to approval by the directors.

5. Employees may anticipate monthly payments, but stock purchased and paid for under this plan will not be delivered to employees until the expiration of thirty months from the date of purchase. Stock purchased for employees will be held by the corporation, in its name, until the conditions of purchase have been complied with, and will then be delivered to employees.

6. Fractional shares will not be purchased for employees, or delivered to them upon settlement of their accounts. Fractional shares of stock dividends will be sold at the market value, and the proceeds held for employee's account.

7. Employees will not be allowed to assign or transfer their rights to stock undelivered under this plan, which rights are personal and contingent upon continuous service.

8. As participation in this plan is voluntary and in no way compulsory, employees may, at any time, withdraw from participation, but in such event they shall not be entitled to any of the benefits of the plan, but shall be entitled to receive only the actual amount of money paid in by them, plus interest thereon at the rate of 6% per annum, computed semi-annually, less the amount of cash dividends and any other cash payments. Employees withdrawing from the plan shall not be permitted to participate in the next succeeding year's subscription.

9. Employees who resign or are dismissed, or who, with or without cause, cease to continue in the service, or who fail to maintain their installments when due, will automatically be withdrawn from the plan, on the same basis as above provided for voluntary withdrawal.

10. In the event of the death of a participating employee, his heirs or legal representatives may pay the balance due on his stock, either in full or in installments, without bonus credits after death, and receive stock certificates, or may withdraw on the terms herein provided for voluntary withdrawal.

11. Continuous service is necessary to entitle employees to purchase stock of the corporation under the liberal terms of this plan, although absence of thirty days or less, due to sickness, vacations, suspension of operations, or leave of absence, will not be regarded as interruptions of continuous service. Absences without leave, aggregating six full working days or more in employee's anniversary year, will operate as a rupture of continuous service.

12. Should this plan be permanently discontinued as of December 31, 1923, uncompleted stock purchase transactions then outstanding may be completed by employees under the above terms.

VACATION PLAN

In addition to the plans under which regular employees receive anniversary checks, stock purchase privileges, pensions and life insurance, the directors have determined to grant

annual vacations of one week, with pay, to factory employees. Very few large industrial corporations in America offer this privilege. This plan involves a heavy annual expense upon the corporation, which employees can largely offset by prompt attendance and loyal application to duty during the remaining fifty-one weeks of the year.

The plan is as follows:

1. All employees who have been continuously in the service of the corporation for two years or more will be entitled to annual vacations of one week, with full pay in the same amount as earned in the last standard week of the anniversary year, in respect of which the vacation is granted, provided their records for the previous year show that they have been satisfactorily prompt and regular in attendance. Occasional unavoidable tardiness or absence of thirty days or less, due to sickness, suspended operations, or leave of absence, will not be regarded as irregularities canceling vacation privileges. Abnormal tardiness, or absences without leave aggregating six full working days or more in employee's anniversary year, will operate as a forfeiture of this privilege.

2. The dates of vacations will be arranged by the management to suit the convenience of employees, and at the same time interfere as little as possible with the work of the departments.

PENSION AND LIFE INSURANCE PLANS

1. Any employee whose annual earnings for the preceding five years average not more than $3,000 per annum, who has been continuously in the service of the corporation for twenty years or more, and who has reached the age of sixty years, may voluntarily retire, or be retired on a pension, the amount of which shall be 25% of his average annual earnings for the preceding five years, with a minimum of $30 per month.

2. This plan is obviously intended to enable employees to retire from active service at a suitable time; therefore, employees drawing pensions under this plan may not engage their services to others without the consent of the corporation.

3. The corporation will continue faithfully to carry out the benefits accruing to employees under the Workmen's Compensation Acts of the states of Indiana and Michigan. In cases of disabled employees receiving benefits under these acts, pensions will not be paid by the corporation under this plan unless, in the judgment of the management, the benefits under said acts are not sufficient to meet the necessary requirements of the case. Each case will be considered on its merits.

4. In the event of the death of an employee of the corporation whose annual earnings were not more than $3,000, who had been in the employ of the corporation continuously for five years or more, and who leaves dependents; or in the event of the death of a pensioner who leaves dependent wife or minor child, the corporation will pay to such dependents the sum of Five Hundred Dollars ($500), in such a manner, at such a time or times, and with such a division of this sum between the dependents as may, in its judgment, best serve their necessities.

5. Should this plan be permanently discontinued as of December 31, 1923, employees then drawing pensions will continue to receive them, and employees who have to their credit, at that time, ten years or more of continuous service, will be eligible for pensions under the above terms, upon the completion of twenty years of continuous service.

GENERAL PLANS

In addition to the plans described in the foregoing pages, the management of the corporation is interested in everything affecting the health, happiness and prosperity of its employees, and a partial description of some of its activities in these directions is given below:

1. Working Conditions. The policy of the corporation is to provide cheerful and healthful working conditions, and its plants are equipped with the most modern improvements in heating, lighting, ventilation and sanitation.

2. Emergency Hospital. The corporation maintains fully equipped emergency hospitals at its Detroit, South Bend and Walkerville plants, in charge of skilled physicians and nurses, who give first aid to sick and injured employees.

3. Workmen's Compensation Act. It is the policy of the corporation to faithfully observe the provisions of the Workmen's Compensation Acts of the states of Indiana and Michigan, and it maintains organizations in its factories for that purpose.

4. Recreation and Amusement. Employees of the plants at Detroit and South Bend

maintain bands, orchestras, ball teams, bowling teams, clubs, etc., and the corporation believes in encouraging such organizations to the fullest extent.

5. The corporation has expended upwards of $2,000,000 for the purchase of sites and for the erection of homes, which are being sold to employees at less than cost, and at very favorable terms.

BONUS PLAN FOR MANAGEMENT FOR 1923

The co-operative plans for the benefit of the large body of our employees whose positions do not involve responsibilities of management will remain in effect during the year of 1923. The payments and credits under these plans are fixed expenses which must be met whether or not profits are made by the Corporation, and labor therefore is receiving preferential consideration in the conduct of our business.

Recognizing the responsibility of management for successful results and the value of efficient work, the directors on April 3rd authorized the continuance of the "Bonus Plan for Management," under which special rewards are offered to management, for the fiscal year of 1923, under the following terms and conditions:

1. No beneficiary of the co-operative plans (anniversary check, co-partnership, vacation, pension and life insurance plans), nor employee holding a contract covering special compensation, in the nature of commissions or participation in profits, shall participate in the Bonus Plan for Management, without the approval of the directors.

2. The Bonus Plan for Management shall be administered by the Finance Committee, and is adopted for the fiscal year of 1923 only.

3. In consideration of the salaries it receives, management must earn certain returns on the investment of stockholders before benefits shall accrue under this plan. After such returns are earned the amount of the bonus fund, if any, for the year shall be determined in the following manner: From the consolidated net profits of The Studebaker Corporation and its subsidiary companies, as certified to by our auditors, there shall be deducted (1) the amount of the 7% dividends due on the preferred stock during the year, (2) the amount which under its charter the Corporation is required to set aside annually in special surplus account for the amortization of preferred stock, and (3) a further amount equal to 7% upon the common stock outstanding. If the net profits exceed this amount (approximately $6,300,000), but not otherwise, certain percentages of the excess net profits will be credited to the bonus fund, as follows:

5%	on	the	first	$1,000,000	of	excess	net profits
6%	"	"	next	$1,000,000	"	"	" "
7%	"	"	"	$1,000,000	"	"	" "
8%	"	"	"	$1,000,000	"	"	" "
9%	"	"	"	$1,000,000	"	"	" "
10%	"	all	above	$5,000,000	"	"	" "

The bonus fund will be distributed among participants according to the importance of the positions held and to the extent the Finance Committee may deem each participant to have contributed to the Corporation's profits by reason of his position, worth and loyalty. The amount to which each participant is entitled will be credited to his account. Either all or one-half of the amount will be promptly paid in cash, and the remaining one-half, if withheld, will be invested in common stock of the Corporation for the account of each participant. Subject to possible forfeiture as mentioned below, 25% of said stock will be delivered to participants within thirty days after February 1st, 1925, 25% within thirty days after February 1st, 1926, and 50% within thirty days after February 1st, 1927, provided participants have continued uninterruptedly in the service of the Corporation to said dates. In case participants resign or are discharged by the Corporation for cause or for any other reason, of which the Corporation shall be the sole judge, they shall forfeit all or any part of said stock which the Finance Committee in its discretion may decide. In case participants die or are disabled through injury or sickness, they or their legal representatives shall thereupon receive the full amount of stock without penalty. Participants shall have no right to assign stock held for their account by the Corporation. All cash dividends received upon said stock will be paid participants upon receipt by the Corporation.

4. In case you are discharged or resign during the year of 1923, you shall automatically forfeit all rights of participation in the bonus fund of this year, but if you are released on account of curtailment in business or shut-downs in the factory, and not on account of lack

of efficiency, you shall receive a pro rata distribution of the fund of the current year, and the full amount of common stock held for your account from previous years, if any.

The position you hold qualifies you to participate in the Bonus Plan for Management for this year, but this statement of intention concerning a voluntary and contingent distribution of a part of the profits of the Corporation does not in any way constitute a contract on the part of the Corporation to make such distribution, nor alter or affect any of its contract relations with you or other employees. Moreover, the Corporation reserves the right, at its discretion at any time, to change or withdraw the plan as a whole or with respect to any individual participant. Unless you accept this offer of participation subject to these reservations, you must at once notify the Treasurer in writing, as in the absence of his receipt of such notification, we will understand that you accept participation on these conditions.

SPECIAL COMPENSATION PLAN FOR SALARIED EMPLOYEES.—(Name of company withheld.)

SPECIAL COMPENSATION PLAN APPLICABLE TO SALARIED EMPLOYEES

1. At the end of each fiscal year, the Management renews its recommendation to the Board of Directors that a Special Compensation Fund be created. If the Board of Directors is convinced that the Management's plan for Special Compensation should be continued, authority is given through proper resolution of the Board to set aside some certain percentage of net earnings, to be distributed as, in the judgment of the Management, will be for the best interests of the Company and its working organization.

2. The percentages of net earnings so authorized to be set aside, will vary from year to year as conditions warrant or necessitate, but will be as liberal as the Board of Directors can be convinced is sound and in the best interests of the Company, its stockholders and its employees.

3. Beginning January 1, 1922, and until due notice of change has been given, the following regulations shall govern the distribution of the Special Compensation Fund.

ELIGIBILITY

4. All employees, other than officers whose entire compensation is fixed by the Board of Directors, who are being paid monthly salary on December 31, the end of the Company's fiscal year, who have at that time been in the continuous service of the company for one year or more, that is, all those who are insured under the Group Insurance Plan, are eligible to participate.

5. At the end of the fiscal year a list will be made of all eligible employees, and this list will be separated into three groups. Classification of individuals will be based on responsibility of position held and the extent to which such position gives the individual opportunity to influence and direct Policies, and to affect Profits.

GROUP ONE will include all heads of Divisions, their assistants and the heads of the principal departments. The members of this group are called SPECIAL PARTNERS.

GROUP TWO will include some assistants and the heads of other departments.

GROUP THREE will include all other eligible salaried employees.

6. Each eligible employee in Groups Two and Three will be furnished with a blank Certificate of Participation each six months. This Certificate must be approved by the Department Head and the Head of the Division to which the individual belongs through a personal interview to entitle the individual to the full amount allotted under the plan.

REGULATIONS GOVERNING DISTRIBUTION OF FUND

7. Two-thirds of the Special Compensation Fund will be allotted to the "Special Partner Group" and will be apportioned to the individuals comprising that group by the Management, as in their judgment seems fair and equitable.

8. The balance of the Fund will be allotted to Groups Two and Three. Other factors being equal, participants in Group Two will receive three times as much as participants in Group Three.

9. The distribution to participants in Groups Two and Three will be made in direct proportion to their monthly salaries as effective on December 31, plus 10% for each full year of service up to and including ten years.

10. Since an employee is credited with an additional 10% increase in his share of Special Compensation for each year's service, the manner of figuring the distribution to participants in Group Three will be as follows:

The figures representing the December 31 salary will be increased by 10% for each year's service of each employee up to and including ten years—and this will give the factor for participation.

Group Two is figured in the same way except that each participant's factor is multiplied by three.

The sum of all the participant's factors in Groups Two and Three is divided into the total sum of money allotted to these groups and the result of this division multiplied by a participant's factor, gives the amount of money to which such participant is entitled.

11. The Special Compensation Fund will be distributed as soon as possible, usually in May following the end of the fiscal year.

12. Not less than 50% of the total amount apportioned to each individual in any one year will be paid in cash at the time of annual distribution; any proportion not so paid will be held in reserve for future cash distribution, over a period not to exceed three years.

13. Only those who were eligible to participate during the year in which a reserve fund was created will be eligible to share in the distribution of that particular fund.

SALARIES

14. Salaries are regulated after giving due consideration to the character and responsibility of positions held, efficiency, general ability shown in discharge of duties assigned, loyalty to Company interests, term of service, and as far as possible to salaries paid to persons holding comparable positions in competitive companies. These factors are considered independently of any plan for Special Compensation.

EMPLOYEE STOCK OWNERSHIP AND PROFIT-SHARING PLANS.—(Name of company withheld.)

PROFIT-SHARING PLAN

The Executive Committee of the ..... Company announces that:

FIRST: There has been set aside a certain sum as a Profit Sharing Fund, for distribution as soon after May 15th, 1920, as shall be practicable, among various officers and employees of said Company and its Subsidiary Companies to be selected by said Committee. In so far as any employee receiving a salary less than $5,000 per annum is selected to share in said Fund, his share will be paid to him as soon as possible in cash. When the salary of the officer or employee thus selected shall be at the rate of $5,000 per annum or more, about 60% of his share of said Fund will be so paid in cash and the remainder, under conditions hereinafter stated, in non-assignable Conditional Certificates of Interest in the common stock of the ..... Company on the basis of $100 per share. If 40% of any such allotment is insufficient to so purchase one share of said stock, then said 40% shall be paid in cash, and if such 40% shall purchase one share or a multiple thereof, then any excess over such purchase price shall be paid in cash.

The Certificates of Interest above referred to shall provide among other things as follows:

(a) That if such participant shall remain continuously in the service of the Company or of one or another of its subsidiary companies until April 1st, 1925, and shall during all of such time have rendered faithful and satisfactory service to such Company or to one or another of its subsidiary companies, the stock called for by his Conditional Certificate will be delivered to him as his property upon surrender of his said Conditional Certificate.

(b) That he will receive such dividends as are declared on the stock, while it is so held for his account.

(c) That if he shall voluntarily quit the service of the Company or of a subsidiary company (except that such voluntary retirement be made under any general

pension scheme which may hereafter be adopted), or shall be discharged or removed for cause by his employer before April 1st, 1925, he shall forfeit all right to the stock and to the Conditional Certificate; and in that case such stock will be held in a Fund which at the end of the five years above named will be divided pro rata according to their respective interests among such officers and employees as shall then be entitled to the delivery of the stock called for by the Certificates of Interest held by them.

(d) That if before April 1st, 1925, he dies, or becomes totally and permanently disabled while in the employ of the Company or of one or another of its subsidiary companies, the stock will be delivered to his estate (or to him if disabled) together with such pro rata amount of additions, if any, as have accrued up to the time of his death or disablement. If a beneficiary has been named in his Subscription Agreement, Series 1920, referred to below, and such designation has not been changed, delivery will be made to the person so designated, if then living, and the participant's estate shall have no claim to such stock or additions.

SECOND: All questions relating to the meaning or construction hereof or to the rights r interests of any officer or employee in, or growing out of, the Stock or Fund above menioned or referred to shall be determined by the Executive Committee of the .... Company and by it alone; and its decision shall be final and conclusive as to ll parties, and the Fund above referred to is to be created on that condition; and the ction of a majority of said Executive Committee shall be as binding and conclusive in very case as the unanimous action of the entire Committee would be.

THIRD: It is understood that the above mentioned Profit Sharing Fund will be distribted and Plan administered with special reference to those whose Subscription Agreement, eries 1920, shall have been approved and accepted by the Company.

By order of the Executive Committee,

EMPLOYEE STOCK OWNERSHIP PLAN

The Company offers to officers and employees, whose salaries are at the rate of Thirteen lundred Dollars per annum or over, the opportunity to subscribe for shares of its Common tock heretofore issued and now held by and in the Treasury of the Company, at the price f $100 per share, subject to the following conditions:

FIRST: All subscriptions shall be for the value of one or more shares of Common Stock at ne price of $100 per share and upon the express condition that there may be allotted to the ubscriber all or any part of his subscription as the Executive Committee may determine.

SECOND: The maximum amount which may be subscribed for hereunder by such officers nd employees respectively will be governed by varying percentages of their respective alaries, which percentages will be determined in each case by the Executive Committee, keeping in mind the salary and position of the individual; and, as respects..... .....such maximum amount is..... (.....) shares.

THIRD: Payment on the subscriptions shall be made in monthly installments, to be educted from the salary of the subscriber in such amounts as he may desire, subject to ne provision that the minimum amount of a monthly installment shall be $10 per share. he subscriber may anticipate such payment to such extent as he may desire, but any nount so paid in anticipation shall be in even dollars. Interest at 5% per annum will e charged by the Company on all amounts unpaid on the stock.

FOURTH: From the date on which payments begin and during the continuation of such ayments all dividends paid on the stock will be credited to the subscription account of the ubscriber until the stock is fully paid for and issued to him, after which dividends will be aid in the same manner as to other stockholders.

FIFTH: In case a subscriber shall cancel his subscription before his stock shall have been lly paid for there will be returned to him the exact amount of his payments made on ccount with interest at 5% per annum on the same from time of payment, no credit being ven him for dividends or for the special allowance referred to in Section Sixth hereof, nd no interest being charged on deferred payments, and thereupon his subscription and l interest in the stock to which the same relates shall cease and determine. Whenever ch payments shall have been discontinued without the consent of the Company for the eriod of three months, his account will be closed forthwith and his interest in the stock all cease and his payments on account will be returned to him as above stated.

No subscriber can cancel part of his subscription unless he cancels all of it.

SIXTH: As soon as the stock shall have been fully paid for and not before, it will be issued in the name of the subscriber. The subscriber may then sell his certificate whenever he chooses, but as an inducement for him to keep it and to remain continuously in the employ of the Company or of one or another of its subsidiary companies, the following offer is made, viz.:

If he does not sell or part with any part of the said stock but shall keep it and on the 1st of April, 1921, and the 1st of April for four consecutive years thereafter shall exhibit the certificate to an official designated by the Company and obtain from him a certificate to the effect that he has been continuously in the employ of the Company or of one or another of its subsidiary companies during the whole preceding year and has shown a proper interest in its welfare and progress, he will for each of such five years receive from the Company a cash payment at the rate of $3 a share for each share of said stock.

SEVENTH: If the subscriber shall retain his said certificate and remain continuously in the service of the Company or of one or another of its subsidiary companies for said five years, the Company intends that he shall then receive a still further compensation, which cannot now be ascertained, but which it is intended will be derived from the following sources, viz.:

Subscribers for stock under this offer whose subscriptions are cancelled before being paid in full will forfeit and will not receive the special allowance of $3 per share referred to in Section Sixth hereof. Nor will such special allowance be paid for such of the five years as remain after forfeiture to subscribers whose certificates may be transferred from their names at any time during the five years, whether intentionally or otherwise; nor to subscribers who after receiving their certificates do not remain continuously in the service as provided in Section Sixth. The Company will, however, pay into a Special Fund at the end of each remaining year of said five years the said $3 allowances forfeited by subscribers as aforesaid. This latter Fund shall be credited with 5% annual interest, and at the end of the five years' period the total amount thus accumulated will be divided into as many equal parts as shall be equal to the number of shares of said Common Stock issued as aforesaid to and then remaining in the hands of subscribers who shall have so continued in such employ for the whole of said five years. The Company will then by its own final determination award to each then remaining subscriber whom it shall find deserving thereof as many parts of such accumulated Fund as he shall be entitled to on the basis of the number of said shares then held by him under this plan as compared with said total number.

EIGHTH: In case a subscriber dies or becomes permanently disabled while faithfully serving the Company or one of its subsidiary companies during such five years' period, payments will be made to his estate or to him as follows:

(a) If his subscription is fully paid and he has received and not disposed of his certificate, the Company will pay, as above stated in Section Sixth a sum equal to $3 per share for each of the five years not then expired, and also a pro rata amount of the Special Fund mentioned in Section Seventh, arising from the said forfeitures which may have accrued at the time of his death or disablement.

(b) If his subscription has not been paid in full, the Company will pay, as stated, the money theretofore paid in by him on account, together with the dividends paid on the stock subscribed for, the special allowance for the entire five years period and a pro rata share of the amount of the Special Fund mentioned in paragraph (a) preceding, less interest at 5% per annum on unpaid amounts.

(c) If at the time of decease or permanent disablement the subscription has been fully paid but certificate not yet delivered, the Company will deliver the certificate, as first stated above, together with the additional payments as mentioned in paragraph (a) preceding.

NINTH: A subscriber may designate in his subscription the person to whom in the event of his death he desires the Company to deliver all amounts or stock in connection with his subscription which would otherwise be deliverable to his estate. When such designation has been made and shall not have been changed, the Company, upon satisfactory proof of death under the conditions of the subscription, will deliver to the person designated, if then living, all amounts or stock in connection with the subscription which would otherwise be deliverable to the estate of the subscriber. When such designation has been made, the subscriber's estate shall have no claim to any such amounts or stock, unless the person designated or his substitute or substitutes should die before the subscriber, and in that

vent delivery will be made to the subscriber's estate. By written notice delivered to the Treasurer of the Company by which he is employed, a subscriber may change the person designated.

Tenth: Subscribing officers and employees whose employment has been or may be suspended by reason of the temporary closing of the Company's plants and who shall continue ready and willing when required to resume their service will not be deprived of the special cash payment of $3 per share per year during such suspension. During such suspension monthly payments will not be required, though if so desired by the officer or employee they may then be made.

In case of the death during such suspension of any such officer or employee, his estate or his designee as above will be entitled to the same benefit accruing to his subscription as if he had died while under employment.

Failure to present the original certificate, as provided, or the withdrawal of a partly-paid subscription or the failure to resume employment when requested will constitute and will be deemed conclusive evidence of the termination of his employment by such officer or employee and a relinquishment of all benefits referred to above.

Eleventh: All subscriptions shall be upon the express understanding and condition that the decision of the Executive Committee of the .....Company, as said Committee shall from time to time be constituted, shall at all times be final with respect to the construction and meaning hereof and to the rights or interests of the subscribers or any question relating to or arising out of the same, and that the vote of a majority of the Committee shall be as conclusive as the unanimous vote of said Committee.

Twelfth: Subscriptions will be received until May 10, 1920, inclusive, and allotment will be made a few days later. The first deductions will be made from May salary.

SECTION 25

ACCOUNTS AND AUDITS

This section deals with the principles and technique of general accounting and auditing. It will be confined to those principles that are of fundamental importance in financial statements and to those matters of technique that are of significance from the administrative standpoint. The financial manager is as much interested in the statements of other corporations as in the statements of the company with which he is associated, and this section is written with regard for that consideration.

Fundamental Principles of Classification

IMPORTANT DISTINCTIONS OF CLASSIFICATION.—The following distinctions of classification are the important ones:

Distinction between depreciation as expense and as appropriation of profits.
Distinction between charges to assets and expense, or, as this is often expressed, charges to capital versus charges to income.
Distinction between charges to depreciation reserve and expense.
Distinction between different classes of so-called reserve accounts.
Distinction between profits and disposition thereof.
Distinction between profits and capital losses and gains.
Distinction between classes of surplus.
Distinction between current assets and other assets.
Distinction between current liabilities and other liabilities.

These distinctions have weight in determinations of **credit rating, earning capacity and capital structures** of every corporation. It is vital to soundness of judgment that the financial manager consider these distinctions critically when he has occasion to analyze the statements of another corporation than his own with a view to appraising its financial stability and earning power.

On the following page is a chart showing classification of all types of debit and credit accounts in five groups that are significant from the financial manager's viewpoint. In the first group are the types of accounts that are exhibited in the balance sheet to represent **financial condition at a given date.** In the second group are the types of **income and expense accounts** which form the elements of a statement of earnings or profits for a given period. The third group is designated capital loss and gain; it consists of types of accounts that represent **increases or decreases in surplus** arising from sources other than the regular operations of one year. The fourth group, which is denoted profit and surplus disposition, includes types of accounts that represent **distribution or appropriation of profits and surplus.** A complete annual report of the financial status and progress of a corporation includes not only a balance sheet and a statement of income and expense, but also a summary of the transactions,

if any, in the class of capital loss and gain and a summary of distributions and appropriations of profits and surplus. Each account in the first four groups, therefore, has its place in the corporation's annual financial report. The fifth group on the chart is supplementary. These accounts may appear in the books during the year but the balances in these accounts do not ordinarily enter directly into annual financial statements.

Classification of All Types of Debit and Credit Accounts

Group	Debit	Credit
1. Balance Sheet	Current assets Fixed assets Other assets Deficit	Current liabilities Other liabilities Depreciation or retirement reserves Depletion reserves Capital stock Surplus
2. Income and Expense	Operating costs Manufacturing, trading, selling, administrative and corporate expenses Depreciation expense Retirement expense Depletion expense Interest expense	Sales Interest earned Other revenues or earnings
3. Capital Loss and Gain	Extraordinary losses and amortization not applicable to operations of one year Premiums on par value capital stock redeemed	Extraordinary gains not included as income of one year Unrealized appreciation Premiums on par value capital stock issued Discount on par value capital stock redeemed
4. Profit and Surplus Disposition	Dividends declared Appropriations for sinking funds Appropriations for permanent investment Appropriations for contingencies	
5. Supplementary (Balances in the accounts opposite are not ordinarily components of yearly statements)	Unadjusted items in suspense Clearing, apportionment and equalization of expense	Profit and Loss (as a closing account) Unadjusted items in suspense Clearing, apportionment and equalization of income Overhead burden Completed manufacturing processes (at estimated or standard costs)

A debit account in any group has a definite significance distinct from that of an account in another group. If any debit account represented on a balance sheet includes elements that properly belong to one of the other groups, then the balance sheet would be inaccurate and might be misleading. The financial manager is continually confronted with the necessity of deciding, both in statements of his own company and in statements of other corporations, whether a certain debit account properly belongs to the balance sheet group or to some other group. Decision as to the proper classification of a debit or

credit account is often a matter of policy. The manner in which a corporation settles such questions is an index of that company's financial policy. For that reason a financial manager who is studying the finances of a company other than his own learns much about that company's financial policies from the character of its accounting policies.

DEPRECIATION EXPENSE.—Directors and executives have full latitude in the determination of provisions for depreciation to be recognized in the books of account. In their discretion they may set the annual allowance for depreciation at a very large amount or make no provision for it whatsoever on the books; or they may fix upon an intermediate course. What they do each year in regard to depreciation is an indication to the astute analyst, who has access to the company's financial statements, whether the management has a **consistent plan of depreciation** or whether the provisions are made to vary according to the exigencies of the particular year. Depreciation is an **operating expense,** not an appropriation of net profits. This view of depreciation is well expressed by the late Professor Henry C. Adams, writing on railroad accounts, but the principle enunciated applies with equal force to industrial accounts.

"When carried to its final analysis the question of formal depreciation charges to operating expenses is simply a question of what constitutes cost of operation, and the time when such cost shall be acknowledged in the accounts. The position which the Interstate Commerce Commission's system of accounts assumes on this point is, that the depletion of an asset which represents an investment through the use of that asset in operation creates an item of cost of operation which should be reflected in the accounts when the fact of such depletion takes place, and that a statement of net revenue made without including this element of cost in operation expenses is an erroneous statement."

The **significance of depreciation** and the **basis for the estimate of the amount** of depreciation are explained in Uniform System of Accounts for Telephone Companies, as prescribed by the Interstate Commerce Commission:

"Depreciation of Plant and Equipment: Telephone companies should include in operating expenses depreciation charges for the purpose of creating proper and adequate reserves to cover the expenses of depreciation currently accruing in the tangible fixed capital. By expense of depreciation is meant—

(a) The losses suffered through the current lessening in value of tangible property from wear and tear (not covered by current repairs).

(b) Obsolescence or inadequacy resulting from age, physical change, or supersession by reason of new inventions and discoveries, changes in popular demand, or public requirements, and

(c) Losses suffered through destruction of property by extraordinary casualties.

"The amount charged as expense of depreciation should be based upon rules determined by the accounting company. Such rules may be derived from a consideration of the company's history and experience. Companies should be prepared to furnish the Commission, upon demand, the rules and a sworn statement of the facts, expert opinions, and estimates upon which they are based.

"The estimate for depreciation of physical property should take into account—

(a) The gradual deterioration and ultimate retirement of units of property which may be satisfactorily individualized, such as buildings, machines, valuable instruments, etc., to the end that by the time such units of property go out of service there shall have been accumulated a reserve equal to the original money cost of such property plus expenses incident to retirement less the value of any salvage.

(b) The depreciation accruing in property which cannot be readily individualized, such as pole lines, wires, cables, or other continuous structures, where expenditures for repairs or replacements of individual parts ordinarily are not actually made until the later years of the life in service of such property, and when made may, therefore, be classed as extraordinary repairs.

"The rate of depreciation should be fixed so as to distribute, as nearly as may be, evenly throughout the life of the depreciating property the burden of repairs and the cost of capital consumed in operations during a given month or year, and should be based upon the average life of the units comprised in the respective classes of property.

"The amount estimated to cover the expense of depreciation of fixed capital should be charged monthly to account No. 608, 'Depreciation of Plant and Equipment' (or to the appropriate clearing account or accounts), and concurrently credited to account No. 102, 'Reserve for Accrued Depreciation—Cr.' "

RETIREMENT EXPENSE.—Public utilities have evolved in recent years a theory of provision for ultimate abandonments of property that departs somewhat from the concept of depreciation. This theory has already been adopted by a large number of public utilities and has received the endorsement of public utility commissions in a majority of the states. Depreciation as a title of an account is supplanted by the term **"Retirement Expense."** The Committee on Statistics and Accounts of Public Utilities has defined "retirement expense" in these words:

"This account shall include such amounts as the accounting company charges to operating expenses, in addition to amounts appropriated from surplus, to provide a reserve against which may be charged the original cost of all property retired from service, plus the cost of dismantling, less salvage. The amounts charged to this account and those appropriated from surplus and credited to the 'Retirement Reserve' shall be in addition to the necessary cost of keeping the plant and equipment in a high state of efficiency through charges to the regular maintenance accounts.

"Note:—It is the intent of the classification that a reserve shall be provided, either through retirement expenses or by appropriations from surplus, or both, sufficient to cover all retirement losses that may reasonably be expected."

As the note in this quotation plainly states, provisions for retirements may be made either through retirement expense or by appropriations from surplus, or both.

DEFINITION OF RETIREMENT RESERVE.—The full significance of the theory underlying the meaning of retirement expense cannot be grasped without reference to the Committee's definition of retirement reserve which follows:

"To this account shall be credited such amounts as are charged to the operating expense account 'Retirement Expense,' appropriated from surplus, or both, to cover the retirement loss represented by the excess of the original cost, plus cost of dismantling, over the salvage value of fixed capital retired from service. When any fixed capital is retired from service, the original cost thereof (estimated if not known, and where estimated, the facts on which the estimate is based should be stated in the entry) should be credited to the proper fixed capital account and charged, plus the cost of retirement, less salvage, to this account. If the credit balance in this account is insufficient to cover the retirement loss, the excess over the balance contained in the reserve should be charged to account No. 132, 'Property Abandoned,' which see, or to other appropriate account.

"The losses which this account is intended to cover are those incident to important retirements of buildings, of large sections of continuous structures, like gas mains or of definitely identifiable units of plant or equipment, and the object of the account is that the burden of such losses may be as nearly as is practicable equalized from year to year, but with due regard for amount of earnings available for this purpose in each year.

"**Note A:** When property is retired whose ledger value has been reduced below original cost, only the remaining ledger value shall be written off as retirement loss.

"**Note B:** When any property is retired whose ledger value is greater than the known or estimated cost, such excess shall be charged to Profit and Loss.

"**Note C:** If any property is sold for more than its original cost, the excess of its selling price over the cost of the property plus the cost of dismantling and selling, shall be credited to this account.

"**Note D:** If the accounting company has, previous to the effective date of this uniform classification of accounts, maintained a reserve under some other title, such as 'Depreciation Reserve,' for the purpose of equalizing retirement losses, the balance in such reserve, as at the effective date of this classification, shall be transferred to this account."

This definition frankly avows that the object of the account is—"that the burden of such losses may be as nearly as is practicable equalized from year to year but with due regard for amount of earnings available for this purpose in each year."

Public utility authorities are contending that allowances for retirement expense should be determined with regard first for available earnings, because **uniformity of earnings and dividends** insures the lowest possible cost of capital in the long run. This view was argued at great length before the Interstate Commerce Commission in 1923 in opposition to the theory of straight line depreciation as applied to electric and gas utilities. The Interstate Commerce Commission has not at this writing announced its position concerning straight line depreciation and retirement expense.

Since retirement expense is **accepted practice for so many public utilities** and public service commissions, the question may arise whether it is sound for industrial corporations. The fact that the rates of revenue and issues of capital securities of public utilities are subject to regulation by state commissions imposes conditions for which there is **no parallel in industrial enterprises.** Public utilities are regulated because they are monopolies. But the federal statutes prohibit agreements of price fixing and the Federal Trade Commission endeavors to rectify conditions of trade that would tend to restrict the course of free competition among industrial enterprises. An industrial corporation that ventures to postpone its provisions for depreciation or to adjust the annual provisions according to earnings of a particular year will not enjoy the entire confidence of investors and lenders; and its ability to raise new capital as needed rests on the maintenance of its credit. With an industrial corporation business standards still demand that depreciation should be first provided for out of earnings before any appropriation for dividends is considered.

One public service commission cannot bring itself to approve the idea of a utility distributing dividends before making provision for depreciation. In a recent decision, the Massachusetts commission said:

"We do not subscribe to the thought that dividends of a public utility should move in one direction only, and that up. Obviously during periods of high interest rates dividends must often be increased to enable a company readily

to dispose of its stock at par. On the other hand, we know of no reason, when the public interest so requires, why high rates of dividends may not be reduced when it will not impair the company's ability readily to obtain new capital, and particularly when done in order to maintain an adequate provision for depreciation. It follows that we do not approve the postponement of provisions for depreciation in order to comply with an order made by us fixing rates."

CHARGES TO PROPERTY OR EXPENSE.—It is a well known principle that properties or materials acquired or installed for permanent use or having a long life should be **charged to a fixed asset account** and that properties or materials purchased for consumption or having a short life should be **charged to expense.** The line of demarcation, however, is not sharp. The clearest definitions of proper charges to fixed asset accounts are to be found in the accounting classification of the Interstate Commerce Commission, which are given in Section 8, page 614. Costs which do not come within these definitions are proper charges to expense.

ALTERATIONS AND IMPROVEMENTS.—Alterations in the nature of improvements are **chargeable to fixed assets.** In the administration of the income tax the Treasury Department has made the following ruling, which is sound:

"No deduction from gross income may be made for any amounts paid out for new buildings or for permanent improvements or betterments made to increase the value of any property, or for any amounts expended in restoring property or in making good the exhaustion thereof for which an allowance for depreciation or depletion or other allowance is or has been made . . . . . (Art. 581.)"

DISCOUNT ON BOND ISSUES NOT A PROPER CHARGE TO CAPITAL.—"Under no ordinary circumstances is it correct to treat discount on bond issues as a charge to capital. It does not represent any property; for it is clearly incorrect to consider that the cost in cash of a piece of property varies according to the credit of the purchaser or constructor. Hence, where any such discounts have been charged to capital assets, it is essential for a proper understanding of the balance sheet that this fact should be clearly set forth. In effect, in corporation finance such discounts are frequently included in capital expenditure, as are many other fictitious items which represent either a sanguine estimate of future gains, or mere "water;" and this is done by the fiction of the sale of the property to a new company at a largely inflated value, for a price including the par value of the bonded debt; the intermediaries in this sale then selling the bonds at the market price. This principle has been extended also to **cases of reorganization** effected without any sale of assets, where the discounts on bonds, as well as bonuses of capital stock issued to facilitate the completion of the reorganization, have all been capitalized. These exceptions must not be taken as a justification for a similar treatment in ordinary cases of financing; and in fact, there is no real justification for their adoption in any case, beyond that of expediency. The whole system has led in the past to many and serious abuses, and the more strict supervision of capital issues which is now being extended over certain classes of corporations, will tend to put a stop to it in all cases. The objection to charging discount on bond issues to capital account must not, however, be held to include such a charge of the **annual instalment of discount for the period of construction** during which interest also is charged to capital account. The rate of interest chargeable to capital should be the actual cost of the money, i.e., the effective rate, and any

approximation to this rate obtained by including that proportion of the discount which belongs to the period would be a permissible charge to capital." (Arthur Lowes Dickinson.)

It is recognized by accountants and by Interstate Commerce Commission that it is proper to carry bond discount in the balance sheet as a **deferred debit** subject to annual amortization which will charge the account off to surplus during the life of the bonds.

DISCOUNT ON CAPITAL STOCK.—The Interstate Commerce Commission has declared that "in no case should discount on capital stock be charged to or included in any account as a part of the cost of acquiring any property, tangible or intangible, or as a part of the cost of operation." The Commission does provide for a deferred debit account in the balance sheet designated "unextinguished discount on capital stock" which remains as such until written off by a charge to surplus.

INTEREST DURING CONSTRUCTION.—Interest incurred during construction is a **proper charge to cost of construction.** Otherwise a concern may find that a profit and loss deficit existed with respect to a new plant before its completion. After completion a plant is expected to earn a sufficient profit to cover interest, but it is unreasonable to apply such a rule before its earning power becomes possible.

The accounting practice of charging interest to construction produces unequal results so far as comparative records are concerned. One concern erects a plant with borrowed money; another concern uses its own capital. Other things being equal, the book records show that one plant costs more than the other. Subsequent depreciation charges of one are more than the other; nevertheless the books merely record the facts. Upon the beginning of operations neither concern showed a loss or a profit; subsequently the operating costs of one are less than the other—as they should be. The benefit is equivalent to a return on the concern's original investment of its own capital.

When questions of **rate-making or public supervision** are in issue, an adjustment of book costs is required. Both concerns should be treated the same. To the book cost of one should be added an amount equal to a fair rate of interest. After the beginning of operations both concerns will then be on the same footing. The allowance for rate-making does not commence until construction is complete or operations begin. If the adjustment is shown in the books (which is not necessary), the corresponding credit is to capital surplus; the income account and rate-making are not affected.

The Interstate Commerce Commission has promulgated this definition:

"Account No. 268, 'Interest During Construction,' should include only such proportion of the interest on funds used for construction purposes and of the discount and expense on funded debt as is equitably assignable to the period between the date of the issuance of securities and the time when the property acquired or the improvement made through such issuance becomes available for the service for which it is intended. The proportion of interest, discount, and expense thus chargeable should be that which the period prior to the completion or coming into service of the facilities or improvements constructed bears to the entire life of the securities issued."

REPAIRS AND DEPRECIATION RESERVE.—Outlays for repairs are chargeable to expense or to depreciation reserve. **Charges to expense** reduce net earnings, **charges to depreciation reserve** do not affect net earnings. The principle underlying the distinction between kinds of repairs is well expressed in Art. 104 of the Federal Income Tax Regulations:

"The cost of incidental repairs which neither materially add to the value of the property nor appreciably prolong its life, but keep it in an ordinarily efficient operating condition, may be deducted as expense, provided the plant or property account is not increased by the amount of such expenditures. Repairs in the nature of replacements, to the extent that they arrest deterioration and appreciably prolong the life of the property, should be charged against the depreciation reserve if such account is kept. . . ."

The tendency of some federal revenue agents is to question **deductions for repairs from income** for income tax purpose on the theory that the usual depreciation allowances include ordinary maintenance. The law permits deductions for maintenance and operation in addition to depreciation. The necessity for allowing both claims is very well expressed in a case in which the court said:

"It will thus be seen that the deductions allowed are to include, not only ordinary and necessary amounts actually paid out in the operation of the property, but also the amounts paid out in the maintenance thereof, and in addition a reasonable sum for depreciation, if any. Now, the operation of a business or property includes payment for labor and materials which go into the actual operation thereof, while maintenance means the upkeep or preserving the condition of the property to be operated, and therefore, in my judgment, includes the cost of ordinary repairs necessary and proper from time to time for that purpose. 'Depreciation,' as used in the statute is not to be confused with ordinary repairs. It is intended to cover the estimated lessening in value of the original property, if any, due to wear and tear, decay, or gradual decline from natural causes, inadequacy, obsolescence, etc., which at some time in the future will require the abandonment or replacement of the property, in spite of ordinary current repairs."

For more detailed specification of **ordinary repairs** as distinguished from **extraordinary repairs,** no authority is more illuminating than the Interstate Commerce Commission classification for telephone companies, in which repairs are defined as follows:

"Repairs, as used in the text of the various operating expense accounts, includes ordinary and extraordinary repairs.

"Ordinary repairs include:

(a) Testing for, locating, and clearing crosses, breaks, grounds, and other line troubles, including routine work intended to prevent such troubles, as, for example, pulling up slack, tightening guys and resetting guy stubs, trimming trees, straightening poles and cross arms, and cleaning and adjusting apparatus;

(b) Replacements of minor or short-lived parts of structures, equipment, or facilities;

(c) Replacements of minor parts of wire plant or equipment made necessary by reason of faulty adjustments, excessive strains, mechanical injuries, or other minor casualties, not provided against in the charge for depreciation of plant and equipment;

(d) Rearrangements and changes in location of plant, except subscribers' station equipment (for which a special account is provided). This includes rearrangements of circuits, reassociation of party lines, rearranging grouping of trunks and calling circuits, recross connecting on distributing frames, rerunning jumper wires, underlining switchboard jacks, etc., together with materials used for such purposes which do not add to the tangible value of such plant;

(e) Recovering salvage and removing retired or abandoned property;

(except subscribers' station equipment) when such costs are not provided for by the depreciation reserve.

"Ordinary repairs are not required to be taken into account in fixing a rate of depreciation.

"Extraordinary repairs include:

(a) Restoring to an efficient or proper condition buildings, structures, or other units of property which have deteriorated;

(b) Substituting, in order to maintain normal efficiency, new parts for old parts of continuous structures, such as pole lines, cables, wires, conduits, etc., where such substitutions do not amount to a practical replacement of any considerable length of such continuous structures;

(c) Restoring the condition of property damaged by storms, floods, fire, or other casualties;

(d) Recovering salvage and removing retired or abandoned property in connection with above work.

"Extraordinary repairs should be provided for by adequate charges to depreciation.

"When it is necessary substantially to reconstruct or to replace a major portion of any unit of property or any important section of a continuous structure, the cost should be handled through the capital accounts; that is, the cost of the property removed or replaced should be credited to the appropriate fixed capital accounts and the new property should be charged thereto.

"All repairs, whether ordinary or extraordinary, should be charged to the appropriate primary operating expense accounts. Extraordinary repairs for which a reserve has been provided should then be concurrently charged to account No. 102, 'Reserve for Accrued Depreciation—Cr.,' and credited to account No. 611, 'Repairs Charged to Reserves—Cr.' "

The above instructions prescribe that both ordinary and extraordinary repairs shall be charged to operating expense. It is further stipulated that extraordinary repairs for which a reserve has been provided should then be concurrently charged to depreciation reserve. The final effect of two entries is that extraordinary repairs for which a reserve has been provided are charged not against income when incurred but to depreciation reserve.

CLASSES OF RESERVE ACCOUNTS.—In a paper read at the annual meeting of the American Institute of Accountants, Chicago, Illinois, September 19, 1922, published in the *Journal of Accountancy* for October, 1922, Mr. H. A. Finney presents a discriminating exposition of the classes and meaning of reserve accounts. In that paper Mr. Finney quotes Mr. Robert H. Montgomery as follows:

"The status of the reserve account is unsatisfactory from the point of view of the professional auditor, chiefly because the term 'reserve' is indiscriminately applied to items which are essentially different."

Mr. Finney continues:

"This essential difference in the nature of various reserves may be shown by three pairs of contrasted illustrations:

"The first pair: When depreciation has reduced the value of a fixed asset, we set up a reserve for depreciation. And when market conditions have increased the realizable value of the same fixed asset, we may set up another reserve for the unrealized profit. Thus one reserve measures the estimated increase in the value of an asset.

"The second pair: A company has capital invested in a mine or other wasting asset. At the close of each period the reserve for depletion is credited with the estimated value of the deposit extracted during the period. This reserve measures a decrease in asset values which has actually taken place in the past and a decrease which is chargeable to the operations of the past. But suppose that a corporation, after providing for all known losses, sets up a reserve for contingencies. This reserve represents a vague and problematical loss; one which has not yet been suffered, which may in fact never be suffered and should certainly not be a charge against the operations of the past.

"The third pair: Taxes are accrued at the end of the period, and a reserve for taxes is set up. This reserve represents a liability, and the offsetting debit records an expense. Contrast this with a reserve for sinking fund, which is not a liability but a part of the surplus. The entry setting up this reserve does not record an expense; it merely records the fact that, because of a contract with the bondholders, a portion of the surplus is temporarily not available for dividends.

"From these illustrations it appears that some reserves are set up because actual expenses or losses have occurred in the past; others are set up because contingent losses may possibly occur in the future; others indicate that profits could be realized by the sale of fixed assets; while others represent neither a profit nor a loss, but a temporary earmarking of a portion of the surplus.

"Some reserves are a part of the surplus; some represent real liabilities; some represent contingent liabilities; some are related to assets, and these asset reserves may show that the property has already decreased in value, or that it may possibly decrease in value at some time in the future, or that it has actually increased in value. Some reserves are set up by charges to profit and loss, some by charges to surplus, and some by charges to asset accounts."

The article by Mr. Finney should be read in its entirety by anyone desiring to study thoroughly the subject of reserves. The following excerpts from his article are enlightening:

"It seems to me that there should be three main groups, with subdivisions, as follows:

I. Profit-and-loss reserves, set up by debits to profit and loss, because some expense, properly chargeable to current operations, has resulted in:
   (a) A decrease in the value of an asset; or
   (b) The creation of a liability.

   (For the sake of emphasis I may say that later in this paper I shall suggest that the term 'reserve' be restricted to accounts of this class, and that other terms be applied to accounts belonging in other classes.)

II. Surplus reserves, representing:
   (a) Conservative provisions for possible future losses, not already incurred; and
   (b) Appropriations of surplus, earmarked as unavailable for dividends because of:
      (1) Contracts with bondholders, other creditors, or preferred stockholders, in relation to sinking funds.
      (2) Action by stockholders or directors intended to limit the payment of dividends for various financial reasons.

III. Reserves for unrealized profits.

"This three-fold classification recognizes that some reserves are set up

because expenses and losses have decreased the net profits; reserves of the second class represent, not deductions from net profit or total surplus, but merely a division of the surplus into two parts: surplus which is available for dividends and surplus which, for the time being at least, is not available for dividends; while reserves of the third class represent unrealized profits which, if put on the books at all, should be kept out of surplus.

"To be a true profit-and-loss reserve, the account must represent a provision for an expense or a loss which has already been incurred and is properly chargeable to current income. It is not necessary that its amount be definitely ascertainable, but there must be a certainty, or at least a high degree of probability, that the loss has actually been incurred as a result of past operations."

Reserve for Contingencies.—"Concerning surplus reserves for contingent losses, I wish to express an opinion on four points:

"First, when a reserve is set up to provide for a loss, the profit-and-loss account should be charged only in case the loss has already been incurred. If the loss is contingent, the charge should be made against surplus. Thus, in closing the books at the end of 1921, a reserve for possible losses in inventories due to any market declines which may take place in 1922 should not be charged against current profits of 1921, because the loss has not yet occurred, it may never occur, and if it does occur it will be a loss of 1922. If a reserve for accidents is being set up at the end of 1921 because future accidents may result in liabilities, this reserve should be a charge against surplus.

"I am willing to go so far as to say that a reserve for fire loss, in case of self-insurance, should be created out of surplus and not out of current income. It may sound radical to say that profit and loss should not be charged when the reserve for insurance is credited, and I am not sure that I would have the temerity to make the assertion if I were not supported by the good authority of Mr. Dickinson, who places the 'provision for insurance against future possible losses from fire and other insurable risks' among the 'mere allocations of surplus.' Moreover, it seems to be a position which can be logically defended. Profit and loss ought not to be charged unless a loss has already occurred. The amount may not be ascertainable, but it must have occurred before profit and loss can properly be charged, and it must have been the result of past operations. Now a loss cannot occur without reducing the value of an asset or creating a liability; and conversely, if the assets have not been reduced in value and if a liability has not been created, there can have been no loss. This seems to be the case when a reserve for fire loss is set up. Until the fire occurs, the assets are still in existence; the net worth has not diminished; there has been no loss which is properly chargeable against operations (even assuming that a fire loss is an operating expense), and the reserve is a part of the surplus. It may be argued that where available experience figures are adequate to furnish a trustworthy estimate of the future loss, a periodical charge should be made to operations to equalize this loss in order to maintain uniformity. The answer to that argument seems to be that an appearance of uniformity is not desirable when there is no real uniformity.

"The second thing I wish to say in regard to surplus reserves for future contingencies is that if a loss does occur it should be charged against the reserve only in case it is an extraneous loss, and that if it is an operating loss it should be charged to profit and loss regardless of the existence of the reserve.

"To illustrate, assume that a reserve is set up at the end of 1921 for possible losses on inventories from market declines which may take place in 1922. If the loss occurs it should be dealt with as other operating expenses are dealt

with and should be reflected in the profit-and-loss account for 1922. Unless the reserve is needed for other possible losses, it should be returned intact to surplus. But if a reserve has been set up for fire losses, the reserve may properly be charged in the event of a fire. A fire loss is extraneous to operations; it is a proper charge to surplus, and the reserve for fire loss is merely a portion of the surplus set apart and retained for the purpose of absorbing such losses.

"The third thing I wish to say is that, since such reserves are in reality surplus, they should be called surplus, although the title of the account should indicate that it represents surplus reserved or withheld from dividends in order to avoid a deficit in the event of some specified loss. I suggest such titles as 'surplus reserved for contingent fire loss,' 'surplus reserved for contingent accident loss' and 'surplus reserved for contingent inventory loss.'

"The fourth thing is that these accounts should appear in the balance-sheet as a part of the surplus. Thus in the balance-sheet we might have:

Surplus:

Reserved for contingent fire loss	$25,000.00
Reserved for contingent inventory loss	10,000.00
Total surplus not available for dividends	35,000.00
Free and available for dividends	60,000.00
Total surplus	$95,000.00

Surplus reserves are "those which are appropriations of surplus, not intended as provisions for contingent losses but designated as not available for dividends because of a contract with bondholders or stockholders or because of some financial policy of the management. In this class we find the reserve for sinking fund, the reserve for working capital and the reserve for extension of plant."

Unrealized Profit Reserves.—"Finally, we come to the third main class of reserves: accounts which are set up because fixed assets have increased in market value and because the write-up ought not to be carried into surplus. For these accounts I suggest the title 'unrealized increment.' For instance, 'unrealized increment in land value' or 'unrealized increment in plant value.' Thus we would get away from one more use of the term 'reserve,' and the term 'unrealized profit' is self-contradictory. If the increase in value is unrealized it cannot be a profit.

"Some might say, Credit capital surplus. In my opinion the word 'surplus' should not appear in the title of an account unless that account contains real surplus, either appropriated for some reason or free for dividends. Let the surplus account contain operating profits, and let the capital-surplus account contain extraneous additions to surplus which, though not arising from operations, are nevertheless realized and legally available for dividends.

"Others may say, Keep the increase in market value off the books. This has often been said, but it seems to me that it is not necessary. It is only necessary to make sure that the corporation does not credit the increase to surplus and incur the risks of using this credit for dividends. If the credit is passed to an unrealized increment account, clearly understood to be unavailable for dividends, and so shown on the balance-sheet, I see no objection to allowing the corporation to show the present value of its fixed property."

PROFIT REDUCTIONS VS. PROFIT DISPOSITIONS.—Is **interest on bonds** to be deducted from income in arriving at net income, or is it a distribution of net income? This question is of the utmost importance because the income statements of corporations cannot be judged in their true relation to invested capital unless the reader of the statement understands the distinction thus

raised and takes pains to examine the statement with that in mind. The practice on this point is not uniform. The **income tax acts** of the federal government allow the deduction of interest paid in ascertaining net income subject to tax. The **Interstate Commerce Commission** likewise classifies interest on indebtedness as a deduction from gross income in determining net income. Interest on debt is a fixed charge unlike dividends which are declared at the discretion of the directors. Some corporations adhere to a contrary principle. The consolidated income statement of the U. S. Steel Corporation reaches a figure described as "net income in the year" before deduction of interest paid on bonds of the parent corporation. Interest on bonds of subsidiary companies apparently is deducted before reaching a figure for net income. The Consolidated Gas Co. of New York reports in its annual statement a figure for net earnings which is stated before deduction of interest on funded and unfunded debt.

PROFITS VS. CAPITAL LOSS AND GAIN.—On this Arthur Lowes Dickinson has written the following in "Accounting Practice and Procedure," in which profit and loss is used in the sense of capital loss and gain, which is the term employed in this section:

"There is a tendency to omit from the account which shows the balance of the year and charge to the account of undivided profits items of a special character or even of an ordinary character which may belong properly to a previous period. As the practice of charging to Profit and Loss in preference to income is to be deprecated, unless in exceptional cases, it may be well to state generally what items may properly be so charged, with the inference that everything which does not come within this classification should go to either Income account or Net Income account. Proper charges or credits to Profit and Loss may be defined as follows:

"1. Extraordinary items of receipt or expense not applicable to any particular year, such as profits realized on sales of property, or losses on sales or dismantlement of property, or due to its reconstruction. The loss in this class of cases is closely related to the renewal or depreciation charges on the same property, which should properly go to the operations of a particular year. Frequently a property is abandoned for purposes of reconstruction, which, if it had not been for such reconstruction, would have remained in service for a long period to come and have been maintained in a perfectly efficient condition at a small fraction only of the loss caused by its abandonment. In such cases it would seem that the proper distribution of the charges between the Income account and Profit and Loss account should be to charge to the Income account so much of the difference between the original cost and the value at the time of abandonment as has not already been provided for through charges to income for depreciation, and to charge the balance—namely, the difference between the depreciated value at the time of abandonment and the scrap value realized —to Profit and Loss account. This is a principle fairly easy of application, which might well be adopted universally.

"2. Discounts and premiums on bonds. Discounts and premiums on bonds are in effect an addition to or deduction from the interest rate paid on the bonds over their life, and as such should strictly be included with interest charges in the net income account by proper instalments each year. In practice, however, it is frequently desired to write off the whole of the discount at as early a date as possible, in preference to carrying it as a deferred and unrealizable asset for a long period of years; no objection can be raised in such a case to providing for the full amount out of the surplus earnings of previous years. It must, however, be remembered that such a course conceals the true rate of

interest paid on borrowed money, the latter being a factor of great importance in forming an opinion on the financial condition.

"On the other hand, ordinary earnings and expenses of previous years omitted therefrom either by mistake or because they were at that time incapable of ascertainment, should invariably be included in Income account and never in Profit and Loss account. To include them in the latter would preclude that account from disclosing over a period of years the true result of that period; and if in one year charges or credits have been understated it necessarily follows that in some other year they must have been correspondingly overstated."

The **Interstate Commerce Commission classifications** prescribe that debits of the following character, among others, shall not be classed as deductions in arriving at net income:

Stock discount extinguished through surplus.
Debt discount extinguished through surplus.
Losses on property and equipment abandoned, sold or otherwise retired.
Relatively large delayed debits relating to revenue and expense of previous fiscal periods.
Adjustments or cancellations of balance sheet accounts.
Losses or deficits not properly chargeable to income, such as uncollectible bills for which no reserve has been provided.
Losses resulting from the sale of investment securities.
Payments of old accounts previously written off.

The Interstate Commerce Commission further prescribes that credits of the following character, among others, shall not be classed as income in arriving at net income:

Profit on property and equipment sold.
Relatively large delayed credits relating to revenue and expenses of previous fiscal periods.
Donations received.
Adjustments or cancellations of balance sheet accounts.
Profit derived from the sale of investment securities.
Collections of old accounts previously written off.

UNREALIZED APPRECIATION.—The treatment of unrealized appreciation is discussed under the head of "Classes of Reserve Accounts" on page 1326. Unrealized appreciation is so often included in surplus, or described as a part of surplus, that it is so classified in the chart on page 1316. Under certain conditions there may be legal justification for including unrealized appreciation in unappropriated surplus account.

CLASSES OF SURPLUS.—The separation of surplus into accounts which disclose its composition frequently affords information of great importance to those who use balance sheets. Consolidation of the surplus accounts is sometimes resorted to when there is a desire to conceal material changes in financial condition. **Good accounting practice** requires proper segregation and does not sanction the consolidation of surplus accounts when such action tends to make a balance sheet less understandable.

Accretions to capital arising from reappraisals, from sales of capital assets, from gifts, from premiums on capital stock, etc., are known as **capital surplus.** When the amounts are substantial, separate accounts for each should be shown. The excess of the book value of assets over liabilities and capital stock at the time of incorporation is known as **paid-in surplus.** Subsequent contributions by stockholders, in cash or property, when additional capital stock is not issued, are also a part of paid-in surplus. Accretions to capital from earnings con-

stitute **"earned" surplus;** earnings which corporations agree to set aside as not available for current dividends are known as **"appropriated" surplus.**

The term **"undivided profits"** usually refers to the balance of current net income not transferred to surplus account in the books. There is no actual difference between the terms "earned surplus" and "undivided profits," except in the case of national and state banks and trust companies, which make a distinction between surplus and undivided profits; the amounts which are definitely transferred to surplus are treated as additional capital, and are not available for dividends.

Surplus, in the balance sheet, should be divided into three general groups:

1. Capital surplus
2. Appropriated surplus
3. Surplus

The first and third groups are self-explanatory. It is important, however, to ascertain that capital surplus is not diminished by operating losses, nor by dividends, unless the dividends have specifically been declared from capital. Any changes in capital surplus during a fiscal period should be shown in detail in the balance sheet or in accompanying schedules. This precaution is of unusual importance when no-par value stock appears in a balance sheet.

It is not necessary to credit the **profit from the sale of capital assets** to capital surplus. It is true that earned surplus should represent net income derived from the normal operations of a business; but profits realized from extraordinary sources are not true capital surplus. Capital surplus arises from contributions by the owners of a business; profits arising from any subsequent dealings with the public are not in the same class. It has been said that when treasury stock is purchased at a discount, paid-in or capital surplus should be credited with the discount. This is a fallacy since there has been no new contribution of capital. One of the owners surrenders his interest for less than its book value and the remaining owners have a greater relative interest in book values than before the purchase; but the actual result is an appraisal of book values at less than face value. The transaction is not one which justifies writing up any surplus account.

There is little net or final difference between the profit arising from the sale of normal product and from the sale of surplus plant. Plant or property accounts may have been excessively depreciated so that apparent profits realized from sales do not represent actual net profits. When capital assets disposed of at a profit are to be replaced, it is not expedient (although it is not improper accounting practice) to credit the profits to earned surplus, since the gross proceeds of the sale presumably will have to be used in making the replacements. Under such circumstances the profits should be credited to special surplus or to replacement accounts and not made available for cash dividends. It may be said, therefore, that profits arising from sales of capital assets are capital or special surplus or earned surplus, depending on the disposition of the proceeds.

There is no real distinction between capital surplus and paid-in surplus. The latter term appears in excess profits tax procedure as a convenient term to describe capital surplus arising from specific sources. The term should not otherwise be used. As stated elsewhere, surplus may be divided or appropriated by contracts with creditors or other outsiders or by action of boards of directors. So far as balance sheets are concerned there need be only two groupings: One to represent capital or appropriated surplus; the other free or earned surplus.

Capital surplus and earned surplus are terms frequently used in **tax laws and regulations.** In general, tax procedure should follow good accounting practice,

except when tax laws are specific in departure therefrom. When tax laws do not define capital and income, good accounting practice governs.

The second group of surplus, **appropriated surplus,** should be divided into as many separate accounts as are necessary to show clearly all compulsory and voluntary segregations. As to **compulsory segregation,** we find the following reserves for retirement of securities:

(a) Reserves for retiring bonds, notes, etc.
(b) Reserves for retiring preferred stock.

As to **voluntary segregation** we find:

(a) Reserves for working capital.
(b) Reserves for dividends.

CURRENT ASSETS.—The **segregation of current assets** assumes the utmost importance in the minds of creditors who lend on the basis of statements submitted to them and of bankers who negotiate the terms of preferred stock provisions and bond indentures. Notwithstanding the wide use of the term "current assets" in business and financial circles, there is **no authoritative definition.** The Federal Reserve Board, as far as is known, has not formulated a definition of current assets. It is believed that the Federal Reserve banks classify current assets in balance sheets of industrial corporations somewhat differently than do the commercial banks. A definition of current assets which might satisfy lenders on commercial paper would differ from many **definitions in preferred stock provisions and bond indentures** in which the terms have so often been agreed to only after negotiation and compromise. There is a tendency, however, on the part of lawyers who draw the agreements, to insert, in lieu of an attempted definition of current assets, a clause to the effect that current assets shall be as determined in accordance with good accounting practice by a certified public accountant appointed by the corporation subject to the approval of the registrar or bond trustee.

A definition of current assets has been reported by a committee of the American Institute of Accountants and was published in the bulletin of that organization for May 15, 1924. That **definition** is as follows:

"Current assets have been defined as cash, receivables from outsiders, and inventories of stock in trade, which in the regular course of business will be readily and quickly realized, together with such additional assets as may readily be converted into cash without impairing a business or enterprise (e.g., marketable securities other than those held for purposes of control, notes or accounts receivable from officers, stockholders or employees)."

The committee adds that "in practice it is usual in the case of a manufacturing concern to include the working assets, such as supplies, under the general caption of 'current assets.'"

The above definition expresses the rule as commonly understood to govern the classification of current assets on balance sheets submitted to noteholders. A definition **of current assets for a preferred stock agreement** is given as follows:

"Current Assets" shall include:

(a) Cash on hand and in bank, including cash in the sinking fund; good and collectible notes, accounts, bills, and trade acceptances receivable, including accrued interest and rents and royalties receivable, but not including receivables representing advances made to finance the acquisition of fixed assets; and prepaid insurance, interest, and taxes, and other prepayments.

(b) Manufactured products; products in process of manufacture, and materials and supplies, such products, materials, and supplies to be valued on the basis of actual cost, or market value, whichever is lower.
(c) Bonds of the United States government at not exceeding their market value.
(d) Certificates of indebtedness of the United States government at not exceeding their par value.
(e) Other readily marketable securities paying regular interest or dividends, valued at not more than the market value thereof (excluding bonds or stocks issued by the company or by a constituent company, or issued by a corporation of which the company or constituent company shall at the time own or control, directly or indirectly, a majority of the capital stock).

This definition admits **prepayments;** that of the American Institute of Accountants does not. In that respect the Institute definition is carelessly drawn and is inaccurate. The prepayment of January rent on December 31 is as much of a current asset as if the payment were not made until January 20 and an equivalent amount of cash were included in the balance sheet of December 31. It would also have been a better definition if the expected time of realization of the various items were limited to one year.

In **conveyance clauses of bond indentures** the specifications of properties subject to mortgage involve agreement as to current assets that shall be excluded from the encumbrance. It is not easy to distinguish in brief language between kinds of apparatus, implements, tools and supplies. Some may be current assets; some may be fixed. The word **"supplies"** is too indefinite to serve as an unmistakable line of demarcation between current assets and fixed assets. The properties mortgaged must be specified with particularity to avoid misconstruction.

CURRENT LIABILITIES.—The provisions in a **preferred stock agreement** give the following definition of "current liabilities":

" 'Current Liabilities' shall include: accounts, bills, notes, and acceptances payable, maturing within one year after their date; loans from banks and bankers; salaries, wages, interest, rents, royalties, and taxes accrued, including income and excess profits taxes."

SUPPLEMENTARY ACCOUNTS.—Supplementary accounts as the term is used here are those which may be kept during a corporation's fiscal year but usually are closed out before finally closing, so that they do not ordinarily appear in the balance sheet or statement of income and expense. Typical examples of accounts of this class are described below.

Suspense Accounts.—A **suspense debit account** is charged with items that cannot be otherwise classified until additional information is received. A **suspense credit account** has its origin likewise in transactions the ultimate classification of which is for the time being both indeterminate and uncertain. An **example of a suspense debit** is the cost of tentative or preliminary surveys, designs, and investigations made for determining the feasibility of projects under contemplation, which may thereafter be definitely undertaken or abandoned. The former disposition would determine the cost to be a charge to a permanent asset account; the latter would fix it as a charge to an expense account. An **example of a suspense credit** is the receipt of money under a lease-purchase contract by the terms of which property will be conveyed only upon completion of payments over a stated period, so that it is indeterminable,

at the time instalment monies are received, whether they shall ultimately be applied as sales of property to be divided between cost of property disposed of and gain or loss, or whether they shall be wholly income.

Suspense accounts should not be used as a repository for transactions the classification of which is determinable at the time. Suspense items like the examples just given cannot always be cleared by the end of the fiscal year, but many suspense accounts can be disposed of, or at least given their probable classification, in the annual balance sheet or statement of income and expense.

Clearing Accounts.—In the terminology of the Uniform System of Accounts for Telephone Companies as prescribed by the Interstate Commerce Commission, clearing accounts "are provided for certain expenses which usually affect several classes of operations but need to be brought together in one account in order that the total of the expenses may be known and properly distributed." The **sub-accounts** of this group, with the **bases of clearance** prescribed by the Interstate Commerce Commission, are these:

Shop expense—should be cleared by apportioning the total amount of the expenses to the various jobs on an equitable basis.

Stable and garage expense—should be apportioned to the proper accounts according to use, or the debits to the expense accounts may be made at rates per hour of service which distribute the total expense equitably.

Tool expense—should be cleared by adding to the expense of repairs and cost of plant installed such amounts as will equitably distribute the total expense for tools.

Supply expense—should be cleared by adding to the cost of materials and supplies passing through stores a suitable loading charge which will equitably distribute the total cost of conducting the stores and by adding to the cost of such supplies as are bought by the purchasing department a pro rata share of the total expense for the purchasing department.

Engineering expense—should be cleared by apportioning the total expenses to operating expenses and fixed capital accounts on the basis of service rendered, as determined by the actual time devoted to particular jobs or on an equitable basis fixed by the officers of the company.

Plant supervision expense—should be cleared by charging directly to the appropriate accounts such expenses as can be allocated to particular pieces of work and by charging out the balance on the basis of labor employed in all construction or maintenance work in progress.

House service expense—should be cleared by apportioning the entire expense to the operating expenses of other accounts on basis of the use made of such property.

Clearing accounts should be cleared during the fiscal year so that balances will not appear in them at the end of the year.

Apportionment Accounts.—The purpose of an apportionment account is similar to that of clearing accounts. An example is "steam generated apportionment account" which is defined in the Uniform Classification of Accounts for Electrical Utilities (November 1922) in this language:

"This account will be raised only by companies operating, in connection with electric utilities, other utilities or departments which make demand upon the same boiler plant.

"Where a demand of this character is made upon a boiler plant, the expenses incident to generating steam shall be transferred from the foregoing accounts to this account at the close of the period. The total cost of generating steam

as then shown shall be apportioned to the utilities or departments using the steam, by credits to this account. The balance remaining in this account will represent the cost of steam for generating electric energy."

A general instruction in the classification just referred to is that charges to operating accounts and credits to apportionment accounts "should, unless there is some good reason to the contrary, be so distributed that the costs for any one year will be absorbed by the transactions occurring during that year."

Equalization Accounts.—The Interstate Commerce Commission issued instructions in April, 1921, defining equalization accounts for steam roads. The following is quoted from those instructions:

"When carriers adopt a budget or estimate of expenditures for maintenance of fixed improvements or equipment for the year, such authorized estimates may be equalized by division into twelve equal parts, if for a full year, or into a number of equal parts corresponding to the number of months remaining in the year after the adoption of the maintenance program. If advantage is taken of the optional accounting prescribed in this section, the appropriate primary accounts chargeable with the actual expenditures and the equalization account combined shall contain, each month, amounts aggregating one of such equal parts.

"The equalization accounts are provided in order that their use may show, for each month, the adjustment necessary between actual expenditures included in the other primary accounts and the equal monthly proportion of the estimated or authorized maintenance expenses for the period."

The purpose of equalization accounts is to **distribute maintenance expenses evenly** through the months of the fiscal year. The rule of the Interstate Commerce Commission is that equalization reserve accounts "shall be closed annually unless at the close of the year a credit balance remains therein due to the non-completion of maintenance work because of adverse labor conditions, non-receipt of material or similar reasons, in which case such part of the balance as applicable to unfinished work may be carried over to the following year."

Overhead Burden.—In cost accounting, an overhead burden account is credited with the amounts of overhead expenses that are distributed to operating departments or to costs of production. There should be no balance in this account after the books are finally closed at the end of the fiscal year.

Estimated Costs of Processes.—In cost accounting it is common to credit to a special account, bearing such title as "cost of completed process," the amounts assigned in lieu of actual costs. This type of account is employed for such processes as heat treating, nickel plating, and the like, where actual costs of separate parts are indeterminate and amounts are assigned thereto on the basis of estimated or standard costs. Comparison of the total credits to this account with the total actual costs of labor, supplies and departmental expense over a period, proves whether the estimated or standard costs in the aggregate are too high or too low.

Such accounts are not dissimilar to the credit account "production expenses transferred," which is defined in the Uniform Classification of Accounts for Gas Utilities (November 1922) in these words:

"This account shall include such part of the accounting company's cost of producing gas as is properly chargeable to another co-ordinate department, as, for example, an electric railroad or an electric light and power department."

Fundamental Principles of Valuation

BALANCE SHEET AND INCOME STATEMENT.—The balance sheet of a going concern is founded on the **amounts of capital invested in the enterprise,** as augmented by undivided profits. That is the accepted basis of valuation implicit in the balance sheet. The balance sheet does not purport to show the value of the company's capital stock. There is no relation between capital and surplus on the balance sheet and the market value of the stock.

A principle underlying a true **statement of income and expense** is that earnings taken into account shall have been **actually realized.** With few exceptions there is unanimity of practice on this point. Opinion and practice are divided, however, regarding the provision that ought to be made for losses in statements of income and expense. Industrial corporations are more conservative in this respect than the Congress and public utilities. Industrial corporations generally are disposed to make ample provisions in their statements of income and expense for losses foreseen as likely to occur, whether actually sustained or not. The federal income tax statute permits deductions for "losses sustained during the taxable year." An exception in the statute is that the taxpayer may deduct, "in the discretion of the Commissioner, a reasonable addition to a reserve for bad debts." Public utilities postpone still further the provision for losses, as evidenced by their definition of "property abandoned" account, as provided in the Uniform Classification of Accounts for Electrical and Gas Utilities, which is:

"This account is intended as a suspense account which shall include the retirement loss (i.e., the original cost, estimated if not known, plus cost of dismantling, less salvage) on property destroyed or abandoned because of replacement, of obsolescence, of an extraordinary casualty, or for any other reason, when such loss has not been provided for in advance through a reserve. Amounts thus charged should be amortized through annual or more frequent charges over a definitely determined period to such accounts as shall be proper."

The Classification of Accounts for Steam Roads permits forward amortization of losses sustained on approval by the Interstate Commerce Commission.

VALUATION OF FIXED ASSETS.—The principle of valuation of fixed assets as generally accepted by industrial corporations is the same as that which is clearly defined in the Uniform Classification of Accounts for Electrical Utilities (November 1922):

"All charges to fixed capital accounts shall be at the actual cost of the property acquired, at the time of its acquisition. A bona fide contract or agreement of purchase and sale between entirely separate parties shall be prima facie evidence of actual cost. Each item of property shall be carried in the fixed capital accounts at no more, and no less, than its actual cost unless, or until, such property is abandoned, replaced, reconstructed, or converted. . . . The term 'cost' includes not only the cost of labor, material and supplies directly employed or consumed in the construction and installation of fixed capital, but also the cost of preliminary plans and surveys and such portion of the expenses for engineering and plant supervision and of general expenses as may be chargeable to the fixed capital accounts under an equitable plan for apportionment of such expenses."

PROFITS ON COMPANY'S OWN CONSTRUCTION.—Such profits ought not to be taken into the income and expense statement. Arthur Lowes Dickinson comments as follows: "Managers of the operating departments of a factory frequently claim that they should be allowed to charge a profit on construction

work carried out for their own mills, on the ground that if the work were done outside, they would have to pay a profit, and at the same time would set free their own facilities to carry out additional work at a profit for outside customers; and they even go so far as to say that, if they can not charge a profit on construction work so carried out, they will in future have the work done by outside contractors. . . .

"There is here a **confusion between a profit and a saving.** The reason that a concern undertakes its own construction work in place of letting outside contracts therefor, is that it can by that means effect a saving in its expenditure by taking advantage of its own capital and facilities to carry out the work, instead of using the organization and the capital of others, upon which it would have to pay a profit. The saving so effected is of considerable advantage, in that it reduces the amount of capital invested, and future earnings will represent a larger return on the investment. Moreover, it is seldom true in a well-managed going concern that the use of its facilities for construction expenditure involves giving up profitable work for outsiders, which would otherwise have been undertaken; the situation will have been foreseen and arrangements made so that its organization may, almost automatically, expand sufficiently to provide for any increase in its operations which is likely to be thrown upon it. In the contrary case it would be difficult to find justification for increasing costs of construction because of the lack of foresight of the management. Moreover, if a sum be added to the cost of construction and credited to Income account, to represent the profit which would have been earned by the company if the work had been done for outsiders instead of for itself, this profit can only be made available for distribution by increasing the amount of capital contributed for new construction work; and it can hardly be considered good financial policy to increase indebtedness or take in new partners merely for the purpose of paying dividends. The only sound principle that can be adopted is to charge to construction all costs and expenses which are directly attributable to that construction, together with a fair and moderate proportion of necessary indirect expenses and of interest actually paid, but no further amount to represent profit.

"In England the Companies (Consolidation) Act, 1908, now provides that when any shares of a company are issued to provide money for construction purposes, the company may, subject to certain regulations and to the approval of the Board of Trade (a government department), pay interest on such shares to the stockholders at a rate not exceeding 4% per annum during the construction period; and that the interest so paid may be added to and form part of the cost of construction. This provision does not permit of the addition to construction cost of any interest which is not actually paid out in cash.

"If an asset is created by construction without including in the charge all the elements which an outside contractor would charge, the value based upon market prices will clearly be low. The saving so effected is of undoubted benefit, in that less capital has been employed upon which profit has to be earned, but the asset value is understated. On the ground already stated that no profits should be made out of construction, this difference in value cannot be considered as a profit arising out of operations; but there can be no objection to treating it as surplus appropriated to capital purposes, provided always that the total book value of all assets together is not in excess of actual value."

REVALUATIONS OF FIXED ASSETS.—Capital assets should be **carried at cost** unless and until some change occurs which justifies a revaluation. In a going business, the ownership or control of which does not change, revaluations may be made at any time provided the changes between original costs and

revaluations are clearly shown. When **appraisals** are made in which **appreciation** is included, there is no objection to setting up appraised values in balance sheets, provided the valuation is qualified by an explanation and provided the excess of the appraisal above book value is **credited to special or capital surplus** and is not merged in earned surplus. This practice is not permissible, however, under an agreement with creditors in which fixed assets are mentioned but are not specifically defined. It would be deemed to be a breach of such an agreement if book values as stated at the date of the agreement are increased, except for actual additions to property.

VALUATION OF SECURITIES OWNED.—The distinction between **permanent investments** and **marketable investments,** according to Mr. Dickinson, is that "the former cannot be sold without in some way affecting the activities of the owner, while the latter representing merely the temporary deposit of surplus working capital can be disposed of at any time without in any way affecting such activities. The distinction is a most important one and has an equally important bearing on the financial position of an undertaking by reason of the fact that the investment in the former class of a portion of the current assets withdraws those assets from the general use of the business and prevents their use for the purpose for which current assets are intended, namely, the conversion as rapidly as may be from cash into products for sale and so back into cash again. The conversion of any part into assets of a permanent nature diminishes the current assets and can only be offset either by reducing operations or increasing liabilities, unless the current assets are in the first instance more than sufficient for all needs. If permanent investments are included in current assets, it is impossible to get a clear view of the facts."

Permanent investments are usually **carried in the balance sheet at cost.** Effect should be given, however, to any reduction in value which may be judged permanent. The Interstate Commerce Commission allows a company "the option of carrying its investments in securities other than those issued or assumed by it either at cost or at a reasonable valuation other than cost."

VALUATION OF INVENTORIES.—"Sound commercial principles require that no credit be taken for profits until they are realized; but further, that if there is any possibility that what remains unsold may not realize its cost, a proportion of the realized profits on sales which have been made, should be carried forward to cover these possible losses. It is accordingly generally recognized as a correct accounting principle that if the cost value of the inventory exceeds the market value, **a reserve** should be created to bring it down to the latter value, while, on the other hand, if the market value exceeds the cost, no credit should be taken for the profits until they are realized by an actual sale.

"The above is in substance an exposition of the familiar phrase of **'cost or market, whichever is lower.'** This principle has been adopted in the regulations of the Treasury Department in administration of the federal income tax. The Treasury Department also permits valuation of inventories at cost, but the taxpayer must adhere to one method or the other. It is the accepted practice—and this has been made the regulation by the Treasury Department—that the principle of 'cost or market, whichever is lower' shall be applied to each item of the inventory, not to the sum total of the inventory." (Arthur Lowes Dickinson.)

Inventory valuations should not include **interdepartmental or intercompany profits.** In the case of large enterprises where the article which is finally sold to the public passes through several departments or through several companies whose assets will be included in a final balance sheet, it is very important that

any profits which have been included in their figures by the departments or companies when billing the product to other departments or companies, should be eliminated from the inventory prices. If it is not possible to get such actual profit figures, an **estimated reserve** should be provided, based on the best information obtainable to exclude the approximate amount of profits in sales price which has accrued to the department or subsidiary selling the same or furnishing service in connection therewith.

VALUATION AND RECOGNITION OF LIABILITIES.—Every direct liability should be acknowledged on the books as of the date when the liability is incurred. That is the main principle. It holds even though the precise amount of the liability may not be determinable as soon as the existence of the liability becomes known; if indeterminate in amount, the liability should be expressed in the books for the time being at an estimated figure.

Accrued liabilities are accurately defined in the Classification of Accounts for Electrical Utilities (November 1922):

"Accrued liabilities are those not yet due, but which are to become due in the near future and which accrue or grow from day to day, such as unmatured interest, rents, taxes, etc. Credits to accounts representing accrued liabilities whose amounts are not definitely known, as in the case of many taxes, are made on the basis of estimates which are adjusted when the proper amounts become known."

The federal income tax accrues as the earnings accrue. A corporation going out of business before the end of the taxable year is nevertheless liable for tax on the income earned during any part of the year.

"In close connection with the subject of inventory valuation is that of proper provision for all liabilities in respect of the commodities included in the inventory, and on the other hand, for the proper inclusion in the inventory of all commodities for which liabilities have been taken up. Commodities may frequently have been delivered for which no bills have yet been rendered; and on the other hand, they may be in transit from the point of shipment and only received subsequently to the enumeration, while the bills, by the terms of shipment or to take advantage of discount, may have been rendered and paid prior to that date. A similar condition may arise also with sales which may for one reason or another have been billed to the customer while the goods are still on hand. Any good accounting system should provide for such conditions automatically . . . serious errors in balance sheets and profits may easily arise through neglect of proper precautions to guard against such omissions." (Arthur Lowes Dickinson, in "Accounting Practice and Procedure.")

PURCHASE COMMITMENTS.—"In some businesses purchase commitments are represented in the accounts, in many they are not. The reason for the variance in practice may be explained as follows. As long as such contracts are **made in the ordinary course of business** for the purpose of supplying its actual needs as they accrue, no question need be raised in connection with a balance sheet as of a date prior to the date of delivery. In many concerns, however, these future contracts **form a business in themselves,** being made either as a simple speculation or to protect legitimate dealings in a highly speculative market. Such contracts must be taken into consideration in the preparation of the balance sheet, and the losses shown by a comparison between the contract price and the market price for similar future deliveries at the date of the balance sheet provided for. The differences on such contracts may amount to very large sums, and their omission from the balance sheet would give a most misleading view of the position. This condition usually applies only to those classes of commodities which are dealt in on produce exchanges

and in which there is a free market for contracts in future deliveries; and for the proper ascertainment of the profits or losses a thorough knowledge of the methods and rules of the exchanges is essential." (A. L. Dickinson.)

An industrial concern not dealing in future contracts would not take outstanding purchase commitments on its books of account because the direct liability does not arise unless the vendor delivers the goods.

CONTINGENT ASSETS AND LIABILITIES.—Special instructions in the Interstate Commerce Commission Classification of Accounts for Steam Roads prescribe the following treatment of contingent assets and liabilities:

"Contingent assets and liabilities shall not be included in the body of the balance sheet statement, but shall be shown in detail in a supplementary statement accompanying the balance sheet statement. Contingent assets are those without value to the accounting company until the fulfillment of conditions regarded as uncertain. Contingent liabilities include items which may, under certain conditions, become obligations of the company, but are neither direct nor assumed obligations on the date of the balance sheet."

Books of Account

ECONOMY AND SIMPLICITY IN BOOKKEEPING.—Considerations of economy and simplicity, which determine many of the methods of bookkeeping, have given rise to the following principles:

1. The **classification of accounts** should be kept as nearly uniform as possible from year to year so that comparisons may be had without analysis and rearrangement of the accounts. This principle, however, should not deter any progressive organization from instituting improved methods or modifying its accounting structure to correspond with expansion of business.
2. The aim should be to keep few rather than many **accounts in the general ledger** so that they will exhibit as compact a view as can be had of assets, liabilities, income, expenses, capital losses, capital gains, and profit and surplus disposition.
3. The classification of accounts in the general ledger, compressed though it should be, ought not to include any **mixed account;** that is, an account, the balance of which is composed of diverse elements so that it has to be subdivided on the financial statements.
4. The classification of accounts should be **articulated with the financial statements** so that balances in the ledger accounts may be drawn off and entered in the financial statements in the same sequence and without further subdivision or consolidation of items.
5. For convenience and certainty of identification and to save time in the writing of cross references in the books of entry and supporting papers, the accounts should be assigned **code numbers.**

STEAM RAILROAD CLASSIFICATION OF ACCOUNTS.—The Interstate Commerce Commission Chart of Accounts for Steam Roads is an example of a classification which fulfills the above requisites. The present classification has been in vogue since 1914. A steam railroad has as many kinds of operations and transactions as any corporation could possibly have; yet the list of **primary accounts** does not contain relatively a large number of accounts because of the care with which the classification has been designed. Since it provides for all sorts of operations and transactions, it serves as an excellent

guide for the construction of classifications for other lines of business. It is, therefore, reproduced here.

STEAM RAILROAD CLASSIFICATION PRESCRIBED BY INTERSTATE COMMERCE COMMISSION

Primary Accounts for General Balance Sheet

DEBITS.

701. Investment in road and equipment
702. Improvements on leased railway property
703. Sinking funds
704. Deposits in lieu of mortgaged property sold
705. Miscellaneous physical property
706. Investments in affiliated companies
707. Other investments
708. Cash
709. Demand loans and deposits
710. Time drafts and deposits
711. Special deposits
712. Loans and bills receivable
713. Traffic and car-service balances receivable
714. Net balance receivable from agents and conductors
715. Miscellaneous accounts receivable
716. Material and supplies
717. Interest and dividends receivable
718. Rents receivable
719. Other current assets
720. Working fund advances
721. Insurance and other funds
722. Other deferred assets
723. Rents and insurance premiums paid in advance
724. Discount on capital stock
725. Discount on funded debt
726. Property abandoned chargeable to Operating Expenses
727. Other unadjusted debits
728. Securities issued or assumed—Unpledged
729. Securities issued or assumed—Pledged

CREDITS:

751. Capital stock
752. Stock liability for conversion
753. Premium on capital stock
754. Grants in aid of construction
755. Funded debt unmatured
756. Receiver's certificates
757. Non-negotiable debt to affiliated companies
758. Loans and bills payable
759. Traffic and car-service balances payable
760. Audited accounts and wages payable
761. Miscellaneous accounts payable
762. Interest matured unpaid
763. Dividends matured unpaid
764. Funded debt matured unpaid

765. Unmatured dividends declared
766. Unmatured interest accrued
767. Unmatured rents accrued
768. Other current liabilities
769. Liability for provident funds
770. Other deferred liabilities
771. Tax liability
772. Premium on funded debt
773. Insurance and casualty reserves
774. Operating reserves
775. Accrued depreciation—Road
776. Accrued depreciation—Equipment
777. Accrued depreciation—Miscellaneous physical property
778. Other unadjusted credits
779. Additions to property through income and surplus
780. Funded debt retired through income and surplus
781. Sinking fund reserves
782. Miscellaneous fund reserves
783. Appropriated surplus not specifically invested
784. Profit and loss—Balance

Primary Income Accounts

I. CREDITS:

501. Railway operating revenues
502. Revenues from miscellaneous operations
503. Hire of freight cars—Credit balance
504. Rent from locomotives
505. Rent from passenger-train cars
506. Rent from floating equipment
507. Rent from work equipment
508. Joint facility rent income
509. Income from lease of road
510. Miscellaneous rent income
511. Miscellaneous nonoperating physical property
512. Separately operated properties—Profit
513. Dividend income
514. Income from funded securities
515. Income from unfunded securities and accounts
516. Income from sinking and other reserve funds
517. Release of premiums on funded debt
518. Contributions from other companies
519. Miscellaneous income

II. DEBITS:

531. Railway operating expenses
532. Railway tax accruals
533. Uncollectible railway revenues
534. Expenses of miscellaneous operations
535. Taxes on miscellaneous operating property
536. Hire of freight cars—Debit balance
537. Rent for locomotives
538. Rent for passenger-train cars
539. Rent for floating equipment
540. Rent for work equipment

541. Joint facility rents
542. Rent for leased roads
543. Miscellaneous rents
544. Miscellaneous tax accruals
545. Separately operated properties—Loss
546. Interest on funded debt
547. Interest on unfunded debt
548. Amortization of discount on funded debt
549. Maintenance of investment organization
550. Income transferred to other companies
551. Miscellaneous income charges
552. Income applied to sinking and other reserve funds
553. Dividend appropriations of income
554. Income appropriated for investment in physical property
555. Stock discount extinguished through income
556. Miscellaneous appropriations of income

Primary Profit and Loss Accounts

The Interstate Commerce Commission defines profit and loss accounts as a group thus: "Profit and loss accounts are those designed to show the changes in the corporate surplus or deficit during each fiscal period, as affected by the operations and business transactions during that period, by any disposition of net profits made solely at the option of the accounting company, by accounting adjustments of matters not properly attributable to the period, or by miscellaneous gains or losses not provided for elsewhere; and to show also the unappropriated surplus of the carrier at the date of the balance sheet."

I. Credits:

601. Credit balance (at beginning of fiscal period)
602. Credit balance transferred from income
603. Profit on road and equipment sold
604. Delayed income credits
605. Unrefundable overcharges
606. Donations
607. Miscellaneous credits

II. Debits:

611. Debit balance (at beginning of fiscal period)
612. Debit balance transferred from income
613. Surplus applied to sinking and other reserve funds
614. Dividend appropriations of surplus
615. Surplus appropriated for investment in physical property
616. Stock discount extinguished through surplus
617. Debit discount extinguished through surplus
618. Miscellaneous appropriations of surplus
619. Loss on retired road and equipment
620. Delayed income debits
621. Miscellaneous debits

SAFEGUARDS IN BOOKKEEPING AND SUBDIVISIONS OF ACCOUNTS.—Considerations of economy and simplicity give way to the needs of control when the latter is paramount. The practicable problem which the financial administrator so often has to decide for himself is typified by the question: To what extent does it pay to incur the expense of refinements and proofs of accuracy in bookkeeping for the sake of possible savings to be gained thereby? Under the headings immediately following an attempt is

made to outline the principles that will assist the financial manager in answering that question.

Control of Cash and Securities.—No individual in the employ of another, or in the relation of agent or trustee for another, should wish to assume responsibility for the faithful handling of cash or securities without welcoming the **independent verification of his records** by another person. No employer or principal should fail to arrange for a systematic checking of the records of any employee or agent who in the course of his duties has to handle cash and securities. It is for the mutual protection of both parties that this principle should be observed and it implies no attitude of distrust of one toward the other. It is in the observance of this principle that routines of work in large offices are so arranged that no one person has the sole and exclusive duty of handling cash or negotiable instruments of value unchecked by some other individual or department. This principle of organization is to be applied even at the cost of inconvenience or additional expense. **Methods of counter-check** have been devised that accomplish essential proofs of fidelity without entailing inordinate expense.

Stores Control.—Shall **continuous records** be kept of materials in and out of stockrooms? Shall those records, if kept, be for quantities only or for values as well as quantities? Continuous records of stocks of materials are costly to maintain, and to be accurate they must be constantly checked. For that reason the questions just raised are all the more significant. The following principles may be helpful as marking out with some definiteness the degree of control which can be prudently had over stocks of materials:

1. If a stock of goods is not large and the proprietor can personally have oversight of it, there is no need of any records of the items of materials except such data as will enable him to place reorders intelligently in replenishing his stock.

2. If the managers cannot have personal oversight of the stock, but can arrange for physical control of the goods, they may be able to dispense with all records save the very simplest. An example: mass production of a single product by mechanical processes which automatically regulate the consumption of materials.

3. If, in the nature of the materials and because of the size of the organization, the management can neither have personal oversight of stocks nor arrange for physical control fully insuring against misappropriations, then there is need of records. How detailed these records shall have to be is a further question that is answered in (4) to (7) following. Quantity and value both must be considered.

4. The need of control does not always necessitate the keeping of records of the individual items in the inventory. **Stocks in retail chain stores,** for example, are controlled by a scheme of accounting which checks the correctness of the cash sales reported for a period by physical inventories taken at intervals and valued at retail prices. No inventory record is kept with each separate commodity; the clerical expense of such a record would be prohibitive. Yet through the medium of totals for all commodities an effective control is had over the fidelity of each store manager.

5. In some industries records of receipts and issues of each article may have a double purpose, one contributing to essential production records, the other to financial control of the monetary investment. An example is furnished by factories and textile mills that make a great variety of finished products from parts or yarns, considerable quantities of which are carried in stock. Because of wide variations in cost of the components, each receipt and issue has to be

separately priced as a means of obtaining the total amount of inventory in dollars. The expense of this work is compensated for by the dovetailing of the accounting and production records, which makes one structure serve two purposes.

6. The valuation of receipts and issues may be dispensed with in certain industries where the investment in inventory can be calculated easily at the end of the month or period. Industries of the type cited in (2) above may have inventories which can be readily enough valued from the state of the manufacturing process at a given date. The principle of technique applicable here is that if an inventory can more easily and at less clerical expense be valued from inspection at the close of every month, then so far as ascertaining the investment in inventory is concerned the keeping of records in dollars for receipts and issues is unnecessary.

7. When the amount of investment in inventories is large and the amount in dollars cannot be arrived at by physical appraisal, except at inordinate cost and delay, then accounts must be kept to show the changes from month to month in the monetary investment in stocks on hand. The expense of keeping such accounts is large but not disproportionate to the value of control which is thereby secured.

Subdivision of Expenses.—Control of expenses must be applied at the point where responsibility for origination of expense centers. Therefore, the principle of classification of expenses should be to group them according to the individuals in the organization who are to be held accountable for the amount of expense incurred. This principle is in harmony with the classification of expenses in the budget. What is most to be sought for is a **direct relationship between the departments of organization and the classification of the expense accounts.** What has just been said pertains to the **primary accounts.** These may be subdivided, first, according to sub-units of the organization and second, according to the nature of the expense. These subdivisions can be had by the simplest clerical process so that the cost of obtaining the details is low. As long as expenses of subdivisions are called for in executive reports, it is undoubtedly a saving in the end to have them recorded in subsidiary accounting records.

Apportionment of expenses should not be confused with subdivision of expenses. Apportionment should not be carried too far in the general ledger. As a general principle it may be said that the apportionment of expenses from one account to others in the general ledger should be limited to items like clearing, apportionment and equalization which have been described above. It is preferable, as a general rule, to let the original expense accounts remain free of apportionment entries and to credit the amounts of apportionment to special accounts. This method facilitates the preparation of statements from the ledger on the basis of classifications either before or after apportionment, and the mathematics of the apportionment are just as precise.

Cost Data.—Costs of units of product are most serviceable when they can be made use of in **predetermining** when the present scale of selling prices will no longer yield a fair margin of profit. In some degree cost data may be used in the setting of selling prices. That, however, is not so fruitful a service of cost data as that of **regulating the margin of profit** in selling prices set by the general market. Details of cost may profitably be compiled as long as they disclose to the management information which helps it to regulate favorably the margin of gross profit.

Fixed Property Ledger.—A card or loose-leaf ledger recording location, cost, depreciation and other data relative to separate units or classes of land, buildings, equipment and machinery usually repays the expense of maintaining it. A corporation with a large investment in fixed property scattered over a wide territory cannot safely leave to physical inspection alone the requisite control of that investment. Renovations, sales of obsolescent machines and devices, and identification and disposal of surplus equipment can often be advantageously brought about with the aid of property records, and may be overlooked or too long deferred without such records.

BOOKS OF ACCOUNT AS EVIDENCE.—The possible introduction of books of account as evidence **in courts of law** should not be disregarded by the financial manager. Courts are usually unwilling to admit books of account in evidence where better proof might be adduced, for the reason that their admission without careful scrutiny would make it possible for parties to manufacture favorable evidence. If the books are to be admitted they must be books of **original entry,** i.e., they must contain the original or first **permanent** record of the transaction. The ledger, posted from a journal, is not ordinarily admissible. The entries must have been made in the ordinary course of business and at or reasonably near the time of the transactions to which they relate. Entries **must be authenticated** by the person who made them or by some one who can state, under oath, that they are correct. Ordinarily books of account are evidence only of transactions between the parties to the litigation; they cannot be used to prove collateral matters. For instance, books of a partnership are not evidence that a party was a member of the partnership. A witness who made the entries in the books of account may refresh his memory by referring to them. Where the party offers books of account in evidence he renders admissible the unfavorable entries as well as the favorable entries. Because of the evidential value of books of account every entry written in them should be so clear and explicit that there can be no doubt, even years after the transaction, as to its meaning. Entries in the books should be supported by such explanations and references therein as will make plain beyond any possible question what the transaction was that the entry purports to record.

Audits

The purpose of this section is to present to financial executives the salient features of internal and external audits and to furnish a brief description of the procedure ordinarily followed by auditors in making audits.

PURPOSES OF AUDITS.—The **chief purposes** of audits are:

1. To ascertain the actual financial condition and earnings of concerns for:
   (a) The proprietors (individual proprietor, partners or stockholders).
   (b) The executives (managers, officers, or directors).
   (c) Bankers and investors who are considering the purchase of securities.
   (d) Bankers who are considering the discounting or purchasing of promissory notes.
2. To detect fraud or errors.

In addition there is the **moral effect** of an audit, tending to keep the work of the office staff sharply up to date.

INTERNAL AUDITS.—Internal audits are those made by the concern's own salaried auditor. The scope of such audits is generally limited to the **verification**

of the statements prepared by the accountant or bookkeeper of the concern and to the determination that transactions have been correctly recorded by other employes. The staff auditor is also expected to be on the lookout for irregularities and to make suggestions for the prevention of losses.

Internal Auditor's Position in the Organization.—Generally, the internal auditor reports to the treasurer or comptroller. In quite a few instances, however, he is independent of these officers and is responsible only to the head of the concern or someone having authority superior to that of the comptroller or treasurer.

Duties of the Internal Auditor.—The duty of an internal auditor is to make certain that the cash, merchandise and other commodities are handled and recorded in such a manner as to minimize loss or confusion of effort. He should determine that all other transactions are properly recorded and, finally, should verify the statements prepared by the concern's accountant or bookkeeper.

INTERNAL AND EXTERNAL AUDITORS.—The distinction between staff and professional auditors is that the external or professional auditor has, through his contact with diversified industries and institutions, assimilated a fund of knowledge which he is able to draw upon and apply advantageously to each new case on which he is engaged. Ordinarily the internal auditor is limited in experience to the procedure followed by the particular industry in which he is employed. Secondly, the professional auditor, being responsible to external authority is in a position to take a **more impartial view** of conditions than is the staff auditor whose policies may be dictated by his superior officer in the company.

EXTERNAL AUDITS.—The work of the external auditor varies according to the type of audit or examination which is being made. Audits are usually classified as follows:

Cash Audits	Detailed Audits
Continuous Audits	Investigations
Balance Sheet Audits	

Cash Audits.—Cash audits consist of a **verification of the cash transactions** during a given period and of **cash balances** at the close of the period. This type of audit is not entirely satisfactory inasmuch as an audit should cover a verification of all kinds of transactions, not only cash items. For instance, the cash audit would limit the examination to the verification of the payment and its propriety without permitting the auditor to ascertain the final disposition of an asset which might have been acquired through the payment. In a cash audit the auditor merely ascertains that certain funds have been deposited in bank, whereas the more important duty is to disclose items which are not accounted for. The latter condition is accomplished only through a complete audit.

Continuous Audits.—The term "continuous audit" applies to examinations made at intervals with a view to covering a full period by a **series of examinations.** The **advantages** of such audits are that they avoid congestion at the end of the period and errors of principle, clerical errors and fraud are detected at the earliest possible date and corrected before much damage is done.

Balance Sheet Audits.—Balance sheet audits consist of a verification of assets and liabilities and such an examination of income accounts as may be necessary to enable the auditor to certify that the income has been properly stated. As in the case of the cash audit, there are limitations to balance sheet audits, inasmuch as a detailed check of all transactions during the year is not made,

it being sufficient in such audits to certify that as of a certain date the assets then on hand and the liabilities set forth are correctly stated.

Detailed Audits.—Detailed audits include the verification of the assets and liabilities and all or a large part of the transactions of the period under review. In concerns having no satisfactory internal check, the detailed audit is the only kind of an audit through which a complete verification of the income and expenditures for a given period may be made. The **chief distinction between balance sheet and detailed audits** is that in balance sheet audits the work of verification centers at a specified date, whereas in detailed audits the transactions during a fiscal period and their effect must be verified. While the verification consists largely of review and tests, nevertheless the tests must be broad as well as representative, and must cover the entire period under review.

Investigations.—Investigations are examinations made for special purposes. An investigation may cover the verification of all the assets and liabilities and even all the transactions in a period, or it may be confined to a verification of a part of these items, depending on the purpose for which it is made. Some investigations undertaken by the professional auditor may involve intensive examinations of all or certain parts of the records or transactions.

Among the **more important purposes** for which investigations are made are the following:

1. To prepare financial statements for credit purposes or for the sale of securities.
2. To prepare statements for the purchase or sale of a business.
3. To prepare statements for reorganizations, receiverships, arbitrations, etc.
4. To prepare statements to be used in settling matters in dispute, fire losses, claims against bonding companies, claims on contracts, etc.
5. To prepare statements to be filed with governmental or other bodies, such as tax returns.
6. To investigate certain conditions existing and to make suggestions to increase profits, decrease losses or to prevent waste.
7. To investigate the operations of public utilities, governmental departments or special associations for the public.
8. To prepare reports with respect to alleged fraudulent transactions, or for parties in litigation or disputes, such as the determination of the profits derived from the manufacture of patented articles, etc.

QUALIFICATIONS OF THE AUDITOR.—The auditor should have a thorough knowledge of the science of accounts. He should, in addition, have a working knowledge of such kindred subjects as economics, engineering, finance and law, and should keep constantly in touch with current business conditions. He should be possessed of constructive as well as analytical ability. His broad experience should furnish the background for the exercise of good judgment. He should be sufficiently versed in the use of the English language to express his thoughts and findings clearly and in a manner that will be readily understood by the readers of his reports.

NATURE OF AUDITOR'S DUTIES.—The range of duties of an auditor is broad. The particular points which may be covered by his work are governed largely by the purpose for which an audit or examination is made. He should ordinarily make such an examination as to satisfy himself that the **assets** have been **correctly valued** and that the **liabilities,** both actual and contingent, have been **fully stated.** He should also satisfy himself that the revenue has been neither under nor overstated, and that all expenses applicable to the

period, but no more, have been included in the income statement. In the course of his examination he should keep on the alert to discover any irregularities which may exist and to note any weaknesses the elimination of which would tend to increase the profits or prevent waste or loss. Finally, he should, as a result of his work, be able to prepare financial statements in such form as to preclude any likelihood of their being misinterpreted.

BEGINNING OF AN AUDIT.—At the beginning of the audit or, at least, during the first few days, the auditor endeavors to obtain an idea as to the type of report which would make the proper appeal and the data which should be included in, or excluded from his report. Before commencing the detail of the audit, he endeavors to obtain as much information as possible relative to the organization. Also, he endeavors to familiarize himself with the **system of internal check** existing in the accounting procedure of the concern. An internal check consists in the accounting records, methods, and details generally of an establishment being so laid out that no part of the account or procedure is under the absolute and independent control of any one person; that, on the contrary, the work of one employee is complementary to that of another; and that a continuous audit is made of the details of the business. The professional auditor should, furthermore, make it a point to become acquainted with current business conditions affecting the industry under examination.

STATEMENTS TO BE PREPARED FOR THE AUDITOR.—It will be to the advantage of the financial executive if he will arrange in advance for his employes to prepare certain statements, schedules, etc., for the use of the professional auditor. If such data is submitted to the auditor it will expedite the work and reduce the cost of the audit and permit the auditor to spend time on more important work. The following list comprises some of the schedules, etc., which may be prepared to good advantage by the clients' employes:

List of bank balances (if there are many bank accounts).
List of cash funds.
List of cash items in transit.
List of notes receivable on hand (where not too numerous).
List of notes receivable out of office.
List of notes receivable discounted.
List of investments, including mortgages receivable.
List of special deposits made.
List of employees' accounts receivable (where not too numerous).
List of additions to plant during the period (if the items are very numerous, then a list of all items over a certain amount).
Statements of additions to and deductions from depreciation reserves during the period.
Schedules of prepaid insurance, interest, taxes, and other prepaid expenses.
Schedules of deferred charges such as bond discount, organization expenses, etc.
List of notes payable.
List of mortgages payable.
Schedule of accrued interest, taxes, wages, or other accruals.
List of special deposits held.
Schedule of purchase commitments.
Schedule of sales contracts.
Schedule of insurance carried.

Not all these statements will be found necessary in any one audit and the items in each statement for one audit will not be numerous. Many of these statements may be simply copies of parts of certain records which can be prepared by typists with little assistance from the bookkeeper.

Balance Sheet

That the financial executive may be acquainted with the purposes of the work done by the auditor, some of the results which may be obtained in the **verification of the assets and liabilities** are mentioned in the following paragraphs:

VERIFICATION OF ASSETS.—

Cash on Hand.—The examination of the cash funds may reveal the fact that the amount which should be on hand is not intact and that there is a shortage for a substantial amount. It may be found that the fund is represented in part by **memoranda, due bills, etc.,** which are not authorized and which may not have full value. Fairly large amounts carried as cash may represent **prepaid or deferred expenses** which had not been recorded.

Bank Balances.—The examination of the bank balances is made primarily to verify the existence of the cash reported as being in bank and that such funds are **free from liens.** There is a possibility that the persons handling the bank balances may manipulate the deposits or the checks drawn to cover defalcations. The auditor must, therefore, have in mind in his verification the methods through which shortages have occurred. The auditor is also interested in ascertaining whether the balances carried are excessive, in which case a recommendation should be made for the **investment of surplus funds.** If **interest** is allowed **on the bank balances,** it should be ascertained whether the highest possible rate is received. The examination of the bank accounts should bring to light any weaknesses in the methods of drawing, signing or cashing checks, and in the recording of these transactions.

Notes Receivable.—The auditor is primarily interested in determining that this balance represents notes **received through current transactions,** which are not overdue and which will in all likelihood be collected at maturity. The notes of officers and employees and other personal notes which were not received as part of the current operations should receive special consideration, so that they may be stated separately on the balance sheet. Notes which have been discounted may develop into real liabilities if they are not paid by their makers at maturity and the **contingent liability** arising in this connection should be stated clearly on the balance sheet.

Accounts Receivable.—The auditor should assist the bookkeeper and the credit man in keeping the customers' ledgers clean by the **elimination of unadjusted balances of long standing and accounts which are uncollectible.** As a minor duty he should call attention to errors in the accounts and to the ledgers which may not be in balance. He should determine whether all the balances represent customers' accounts which appear to be collectible. The balances due from officers, employees, affiliated companies and other accounts, which do not represent regular transactions, should be stated separately. The examination of the ledger accounts should furnish the auditor with data to determine whether the **reserve for doubtful accounts** is sufficient. From this examination the auditor should be in a position to state whether **credit** is being **extended too liberally** or whether **too severe restrictions** on the extension of credit are

having an unfavorable effect on the earnings. Many concerns pledge their accounts receivable as collateral for loans. When this condition exists, the **extent of the lien** should be clearly stated.

Investments.—In addition to the verification of the existence of documents indicating that the investments are held **free from liens** and to the verification of the income therefrom, the examination of investments includes the determination of the **necessity for the investment** and the ascertainment of the **possibility of increasing the return** on the amount invested.

Inventories.—The examination of the inventories is made primarily to determine that the **valuation** is conservative. The auditor must ascertain that the articles listed are the property of the concern under audit, that the quantities are not excessive, that the merchandise is neither obsolete nor damaged and that the inventory is **priced at cost or market whichever is lower.** The auditor should whenever possible inspect the merchandise and make tests of the accuracy of the quantities. The **condition of the merchandise** should be noted as well as the methods of securing, storing and delivering the merchandise. An examination of the inventory includes a study of the **purchase and the sales contracts,** with special reference to possible losses due to excessive commitments in a falling market, or in a rising market where sales orders have been booked without purchase commitments for corresponding quantities.

Prepaid Expenses.—Overstatements of the assets have frequently occurred through errors of substantial amounts in computing the asset value of prepaid taxes, interest, rent, insurance and other expenses. The auditor should therefore ascertain that such amounts are approximately correct.

Deferred Charges.—There is a tendency in some quarters to defer the charge to operations for experimental and other special expenses to such an extent that both the net income and the assets are unduly overstated. For instance, some concerns defer fairly large amounts representing advertising or selling expenses without justification. The auditor should satisfy himself that there is a reason for each deferred charge and that such amounts are conservatively stated.

Plant.—The examination of plant accounts consists of a complete investigation of the entries in these accounts to determine that only plant items in current use have been included. Buildings, machinery and equipment not in current use should be segregated and stated separately. After the examination of the plant accounts the auditor should be in a position to determine the policy of the concern relative to the **capitalization of minor additions and the making of repairs, renewals, etc.** The auditor must determine whether the **provision for depreciation** of buildings, machinery, equipment, etc., is adequate. His decision will be based to a certain extent on the policies of the concern as to repairs, renewals and the capitalization of minor additions. The balances of some plant accounts may have been increased to take advantage of **appreciation arising from appraisals.** The auditor must satisfy himself in such cases of the reliability of the appraisers and ascertain the basis on which the appraisal was made and the reasons for giving effect to the appreciation in the records.

It may be found that an entry in the plant account represents the first installment paid on the purchase of machinery on a deferred payment plan, the vendor retaining a lien on the machinery until final payment is made. The auditor will insist in such cases that the full contract price be entered in the plant account and the unpaid installments be included among the liabilities and that a notation be made of the lien held by the vendor. When the plant or any portion of it is constructed by the concern itself the auditor has a special

duty to ascertain that the cost of such items does not include a profit to the concern under audit.

Patents, Copyrights, etc.—It should be ascertained that these assets are carried **at cost** unless the cost exceeds their value to the concern. It must also be ascertained that such assets are being amortized over the life of the right. If the value will not carry for such a period, the asset should be written off over a shorter period.

Good Will.—In the case of a going concern, the auditor's only duty is to ascertain that good will is not carried at an amount exceeding cost. Sometimes the auditor is requested to determine the value of **good will in connection with the prospective purchase of a business.** Under these circumstances, he studies the results of the past with the idea of eliminating all elements therein which will have no effect on the future operations. Changes which may be inaugurated by the prospective purchaser are also given consideration. There are many formulas used in calculating good will. It is not possible to enumerate all of them here. A favorite method, however, is to compute the good will by capitalizing on the basis of from 3 to 7 years, the excess value of earnings after allowing adequate salaries for the executives and a return on the investment at, say, from 6 to 10%.

Contingent Assets.—The very nature of these items, which may shortly be converted into real values, makes it important that the auditor give them careful attention so that probable assets of substantial amounts may not be omitted from the balance sheet.

VERIFICATION OF LIABILITIES.—

Notes Payable.—The ascertainment of the full liability for notes payable is in some cases a difficult task. However, if the records are complete, unless there is a deliberate concealment of the proceeds of the notes discounted, the auditor should have no difficulty in ascertaining the total of the notes outstanding. The notes should be classified as to those payable within one year and those payable subsequent thereto. They should also be classified as to those due to—

Banks or bankers	Officers, employees, etc.
Trade creditors	Notes secured by collateral
Affiliated companies	

The auditor should consider whether the amount of the loans or the rate of interest is excessive. He should also consider whether there is a tendency to borrow excessive amounts.

Accounts Payable.—An important duty of the auditor is to ascertain that all liabilities for accounts payable have been included in the balance sheet. The omission of such accounts will not only understate the liabilities but will also understate either the assets, or the costs, if a merchandise invoice is omitted, or overstate the income if an expense invoice is involved. It may be true that very few balance sheets contain a correct statement of the unpaid accounts; however, the accounts omitted are generally very small in amount and as a rule are more than offset by conservative valuations of assets and liberal provisions for reserves. The auditor is specially interested in ascertaining whether there are fairly large amounts of **overdue accounts,** as this may mean that the concern may be called upon to disburse substantial amounts in the near future. If such a condition exists, it is his duty to state the facts so that persons who are extending credit to the concern may not be misled. The accounts payable may be classified as follows:

Trade creditors
Officers and employees
Affiliated companies
Deposits
Credit balances of accounts receivable

Accrued Liabilities.—The auditor should examine the minutes, leases, contracts and other ocuments to make certain that all interests, rents, wages, commissions and other accrued liabilities have been recorded.

Bonds and Mortgages Payable.—The examination of the liabilities for bonds and mortgages includes not only the verification of the amounts and the due dates but also the ascertainment that all the **conditions in the bond or mortgage indenture** are being carried out. The stipulations in the bond indenture may provide for the maintenance of a certain ratio of current assets to current liabilities. There may be a provision that dividends shall not be declared if their payment will reduce the surplus below a certain amount. It is the auditor's duty to see that the stipulations in the indenture are carried out. The liability for bonds or mortgages outstanding should be stated in such a manner that it may be ascertained without difficulty when the payments are to be made.

Reserves.—In addition to the reserves for valuation of assets, such as accounts receivable and plant, there are **reserves for estimated liabilities** where the actual amount of the liability is not known, and **reserves for special purposes** from net income or from surplus. If these provisions are either excessive or inadequate, the financial position of the company may be misinterpreted by persons reading the balance sheet. The auditor must, therefore, make a careful study of these provisions to satisfy himself that there is a need for the reserve, and that the amount provided meets the need.

Contingent Liabilities.—While these liabilities are not definite or actual at the time they are stated, a change in their status to real liabilities may have a serious bearing on the condition of the company. It is, therefore, important that the auditor acquaint himself with all the facts relative to the contingent liabilities so that he may make a fairly definite statement thereof on the balance sheet.

CAPITAL STOCK.—There are many special points which require the attention of the auditor in the verification of the outstanding capital stock. He should ascertain the amount of **accumulated dividends on preferred stock** and set forth this data on the balance sheet. He must acquaint himself with the **rights of each issue of stock** and also the **stipulations** made when the stock was issued. Specific notations must be made on the balance sheet as to those rights or stipulations which have a bearing on the creditors or the equity of different classes of the stockholders. The auditor must call attention to violations, if any, of the agreements made when the stock was issued.

SURPLUS.—The auditor has a special duty to examine closely the entries in the surplus account and to state clearly all items of substantial amount. He must also make certain that there has been no confusion between **earned surplus** which should be available for dividends and **capital surplus** arising from appreciation of assets, gifts, premiums on capital stock, etc.

Income Statement

INTERNAL AND EXTERNAL AUDITS.—The work done in the verification of the balance sheet items for internal audits does not differ materially from that done for the external audit. This is not true, however, of the examination

of the accounts in the income statement. If the **staff auditor** of a small or medium-sized concern is making an examination, he should verify the revenue and expense accounts in detail, while the staff auditor of a large concern should make rather exhaustive tests of these accounts. The **professional auditor,** unless it is otherwise agreed, would make exhaustive tests of the revenue and expense accounts of the small or medium-sized concern, and limited tests when the accounts of large concerns are under audit. In either case, the extent of the verifications made would depend on the condition of the records and the capabilities of the accounting staff.

REVENUE.—The auditor's duty is to ascertain that all revenue earned has been properly recorded. He should also ascertain whether all the revenue which might have been earned under the conditions existing has been received.

Sales.—The auditor should verify the fact that **full value** has been received for the merchandise sold. Illustrations of errors which may be discovered by the auditor include failure to bill merchandise sold, errors in pricing sales, errors in discounts allowed, errors in the calculation of sales invoices, errors in summarizing sales figures, errors in credits made for returns or allowances. The sale transactions should be followed through by ascertaining that cash has been received for all cash sales, that customers have been billed and charged, and that the amounts charged have been collected.

Income from Investments.—Such examination should be made as may be necessary to determine whether **interest and dividends** have been **collected** on investments held by the client and are stated properly in the income statement.

Miscellaneous Revenue.—The examination of the assets and liabilities and the expenditures will reveal transactions which indicate that rents, refunds, special allowances, proceeds of the sales of scrap, etc., should be received. Such leads should be followed to determine whether all the income which should accrue to the concern from these sources has been received.

EXPENSES.—The auditor should see to it that all expenses are properly recorded.

Purchases.—The verification of purchase invoices covering not only purchases of materials and merchandise but expense supplies is an important part of each audit. The examination of these invoices may bring to light errors of judgment as to the quantities purchased or the prices paid, errors in the deductions of discounts or the failure to take advantage of deductions for freight, refunds or other allowances, as well as errors in computation, and in some cases, duplicate payments.

Pay Rolls.—The authorization for the payment in this case originates within the organization, and all steps including the disbursing of the cash are entrusted to members of the organization. The auditor, therefore, has a special duty to study the system in use and to satisfy himself that there are neither irregularities nor negligence in this department.

Other Sources.—There are many disbursements for services other than those included on the pay roll; for instance, rents, royalties, commissions, traveling expenses, etc. The **original papers** for these expenses are, in many cases, prepared by the employees of the concern. These records should, therefore, receive the special attention of the auditor.

Interest Paid.—The interest payments should be examined to determine the propriety of the payment, the accuracy of the computations, and whether

h. rate charged was reasonable. The auditor should satisfy himself that there vas a real need for the amount borrowed.

Office Methods and Miscellaneous

AUDITOR'S COMMENTS.—Whether the audit is an internal or an external ne, the auditor should be in a position when his work is completed to comment n the **adequacy of the records** and the **efficacy of the system of accounts.** He should also be prepared to state that the procedure followed by the receiving nd the shipping departments fully protects the client's interests. The method f handling the **cash receipts and disbursements** and the recording of the cash ransactions should also receive attention. There are in every office many ecords which, while they are not a part of the books of accounts, contain data which the auditor should examine. The adequacy of these records, or the ecessity for their continuance, should be considered. Any lack of co-operation mong the employees which may result in errors or losses, any neglect of indi-idual duties, and any other conditions noted which affect the client's interests dversely, are matters upon which the auditor should comment.

MINUTE BOOK.—Among the subsidiary books which the auditor must xamine is the minute book as it contains data relative to special contracts, lividends, officers' salaries, and decisions of the directors on other matters which should be traced to the books of account.

INSURANCE.—It is a part of the auditor's duty to ascertain that the amount f insurance carried is neither excessive nor insufficient. He must also ascertain whether the client's interests are fully protected through fidelity bonds, con-racts for casualty insurance, use and occupancy insurance, and any other orm of indemnity which may be of assistance in spreading large losses over a eriod of years.

AUDITORS' REPORTS.—Through these statements the auditor tells the **tory of the financial position and the results of operations** of the concern which as been examined. If his story is not well written and cannot be readily nterpreted, the good work which he has done during the audit may be largely ffset by the adverse impression which the client will gather from the report. There should be no standard form of audit report or statements. Many actors militate against such standardization, among which may be mentioned he following:

1. Each business examined has its peculiarities.
2. The capabilities and the views of the individual to whom the report is addressed must be considered.
3. Conditions in the same business vary from year to year.
4. The examination may be made and the report rendered, with some special purpose in mind.

Statements should be limited to the essentials. In many instances a balance heet and an income statement will suffice. It is found advisable in certain ases to supplement these statements with a surplus account, lists of securities wned, lists of special asset or liability items, special cost statements, or other data supporting items in the income statement. These statements should be urnished as a rule only when such data is not otherwise available to the person ddressed, and when it will be of interest to him, or if the adjustments made o the statements prepared by the employees make it advisable to prepare new tatements.

SECTION 26

COST DETERMINATION

COST ACCOUNTS NEEDED FOR MANAGERIAL CONTROL.—The establishment of a suitable cost accounting system is an essential duty of the financial manager. Modern business executives want to know their costs. Manufacturers cannot afford to be without reliable knowledge of the costs of their productive operations and the cost of their finished products, and merchants must know the cost of maintaining their various departments or stores in order to set selling prices intelligently. A **suitable cost system** is one that supplies promptly and with reasonable accuracy the data needed by the management for the regulation of product, the control of operations, and fixing of prices.

The cost system must be shaped to the needs of each business and with full regard for the factors therein which make for success. It should be designed by one who has a knowledge of the operating methods and processes and a keen perception of the points where greatest care must be exercised to avoid losses and where greatest opportunities for economies are offered. The general principles of cost finding are applicable to most businesses, but the methods best for each business differ widely. Almost every industry requires a distinctive system and companies in the same industry use different methods. No one system can be used blindly. In fact, the most practical and effective results are often obtained from a combination of several of the prevailing general types of cost determinations. The primary consideration should be to have a system so fitted to the business that it will **develop information accurately** and in a form to be readily usable by the management. It is the use of costs rather than the system that really counts.

COST ACCOUNTING DEFINED.—Cost accounting may be defined as a procedure for determining the actual costs of the articles produced or services rendered. Costs may be classified as manufacturing, selling and administration. The **manufacturing cost** of an article is made up of the actual cost of all materials directly used in its manufacture, the actual cost of the labor applied in productive operations and a proper proportion of the indirect material, labor and general overhead expenditures. The **selling and administration costs** should be kept separately, because usually the direct control and responsibility for such costs are placed upon different executives. Selling and administration expenses should not be included in costs which are used for inventory valuations, but a proper share of such expenses should be added to manufacturing cost to obtain the total cost required for selling prices.

Cost Systems

SELECTION OF PROPER TYPE OF COST SYSTEM.—The selection of the proper basis for costing is most important. The ascertainment of the

ost of each unit of production should not be considered the sole aim of cost ccounting. The system should be developed to furnish also data which ill be used for factory control and to assist in the selection and arrangement f machinery and plant facilities. The cost accounts should be designed so hat they will provide a check upon the expected results of the sales and pro- uction policies, and, in general, further the development of a sound business olicy. In reaching a decision as to the cost basis, careful study should be iven to the operating conditions and to the proposed utilization of the cost gures.

Cost figures are of little value unless used for constructive purposes; there- ore, the figures must be compiled and presented in such form as to be intelli- ible to the operating organization. **Unit costs** in themselves mean little, but onstructive analyses of such figures often point to production losses which ay be stopped, and at times induce the introduction of improved machinery r better factory organization and layout. The intensive development of pecial machine tools and the inauguration of mass production methods during he last few years evidence the pronounced influence of cost determinations nd studies upon the actions of far-sighted manufacturers.

Even in **highly competitive industries,** where sales prices seem to have but ttle relation to costs, the factory cost of the product must be known. In such nes earnings are dependent largely upon cost reductions and economical manu- acturing. The possibilities of reductions of expenditures are often disclosed n a detailed examination of the items entering into cost by one who has a nowledge of factory conditions. The effect upon unit costs of **increased sales olume,** secured as the result of decreased selling prices, may also be computed. he inter-relation between costs, production volume and sales prices is the asis of the quantity production business policy. The cost accounts are relied pon to indicate the volume needed at the assumed attractive sales prices to over costs and yield a fair return upon investment.

TYPES OF COST SYSTEMS.—The principal prevailing procedures for ompiling costs are the special or production order, the class, the process, the peration, and the product methods. Under the **production order method** a anufacturing order is issued for the production of definite units of standard r special articles and the costs of all material and labor applied to the order re charged thereto. Upon completion of the article, a portion of the indirect actory expenses are added to the total of the direct material and direct labor osts to obtain the total production costs of the finished units covered by the rder.

The class cost method is really a condensed form of the production cost ethod. Its use is extending rapidly, and it is supplanting the special order ethod in many plants because it furnishes essential cost data more quickly nd without confusing details. It is particularly suited to businesses in which he cost of an individual order is relatively unimportant as compared with the ost of all orders for similar classes of goods. The class cost method provides r the ascertainment of a production order cost for any particular order desired. he operation of the class cost method involves a **grouping of orders for like roducts** into classes, after which costs are obtained for classes of production much the same way as under the production order method. When orders re small and numerous, class costs are much more useful than production rder costs because they reflect a composite and average operating cost. Pro- uction order costs for small quantity usually show wide variations due to erical errors or inaccuracies in the materials and labor reports. The mass of

detail work incident to production order costs is a fruitful ground for errors, and much of this is avoided in the class cost method.

In certain types of manufacturing **the process method** is used because it is impossible to segregate or identify definite units of production as they pass through the manufacturing processes. Under this method the actual costs of the materials and labor going into each process are **charged to the process or operation,** as are also the proportions of overhead applicable to the process. The cost of each process is found by dividing the total of the material, labor and overhead costs by the quantities produced. The cost of the finished product is the sum of the costs of each process through which the product passes. The **machine cost method** is a modification of the process type, and the **operation method** is similar, except that usually it ignores the material costs.

IMPORTANT CONSIDERATION IN CHOICE OF TYPE.—The distinction between one type of cost system and another may be very slight. The names for the various types indicate only those features which are emphasized in that particular method. The modifications of each type are many, and they so overlap one another that they are sometimes difficult to classify. The general types should be adjusted to meet local conditions and combined when conditions require a combination type. The type of system should be selected with due regard for the nature of the industry; the nature, volume, and variety of the product; the method of processing the product; and the departmentalization or production centers of the factory in which the goods are produced.

SPECIAL OR PRODUCTION ORDER TYPE OF COST SYSTEM.—The special order type of cost system is generally applicable in jobbing and specialty shops, construction work, repair shops, metal-working, medium and heavy machine tool plants, and factories making a variety of costly units. It is, however, the **most expensive to operate** and it should be used only when the results obtained from the cost figures justify the expense. The **principal determining factors** for the use of this method are the average value and the number of orders handled. If there are a small number of orders for large aggregate values it would be the best system to use, but if there are a large number of orders of relatively small average value, some other type may be preferable.

In the special order costing plan the production orders and the cost orders are the same. The **cost order** is usually a duplicate of the **production order,** and all cost work is closely related to the production work. This is the only system that provides such a direct relation between the production order and costs. Among the **disadvantages** of the special order method of costs are:

1. Errors arising from the large volume of detail work.
2. Length of time required to complete costs on finished orders.
3. Difficulty in handling costs of partial shipments.
4. Lack of analytical data for cost control purposes.

The enormous amount of detail work incident to the special order type of cost system in a factory of average size makes it very difficult to avoid errors and omissions. Unfortunately most of these errors result in understating costs, and unless the accounting supervision is unusually well done, the physical inventory or work in process usually shows that the book inventories are overstated.

The length of time to complete special order costs very often makes them too late to be of any real help in reducing costs. In some cases the cost figures are obtained even too late to be of use in connection with the setting of selling prices, and consequently they are used only for comparisons with the costs

of similar goods produced recurrently. Such limited use seldom justifies the expense of obtaining costs.

It is difficult to ascertain the **costs of partial shipments** under the special order type. When the product is of sufficient size and value, special studies will develop proper allowances for partial shipments. However, under ordinary circumstances there is too much detail and too great a volume of work involved in ascertaining the cost of partial shipments to make it practical. It is customary, therefore, to wait until an order is completed before determining the cost of the units comprising it. If the product is made up from parts manufactured in the plant, the partial shipment problem is very difficult because usually the assembly work is started when a sufficient number of the component parts have been completed and it is not unusual to find that some of the finished product has been assembled and shipped on customers' orders before the production orders for all of the parts required have been completed. Perhaps the best method for overcoming the difficulty of costing partial shipments is to use a carefully prepared estimated cost until the actual cost of the completed order is ascertained, or to subdivide the main order into a number of smaller production orders.

Under the special order system it is customary to make the good pieces finished on each order absorb the entire cost of the order. If the order was for 100 units and 10 became defective in the manufacturing process, the **total cost of the order** would be divided by 90 to determine the unit cost of each finished piece. In some industries it is customary to credit the orders with the scrap produced at **scrap value.** In other industries the materials credited to the individual orders may amount to more than the material absorbed in the cost and the nature of the materials used makes it possible for the returned material to be used in regular production. In such cases the orders are charged with the entire value of all materials drawn from stores and credited with the full value of the material returned in good condition.

The special order type of cost system is of little value for any purpose other than the **setting of selling prices.** Other types of cost systems furnish much better information for managerial control and can be maintained with a much smaller clerical force. There appears to be a **gradual abandonment of the special order type** of cost system in the larger industries in favor of simpler and less detailed methods of cost determination.

CLASS TYPE OF COST SYSTEM.—The class type of cost system can be used advantageously in **plants making relatively small lots of various products** and as a supplemental system in certain departments. It has been successfully operated in jobbing foundries where small work is done, in novelty manufacturing concerns, in heat treating departments, grinding shops, and in companies where the variety of goods produced was too great to permit an analysis of individual products. Under this system a monthly cost is obtained for each class into which the products are grouped. The system eliminates much of the detail work of the production order method and has the advantage of providing prompt and reliable information for the setting of selling prices if the goods have been well classified. The direct object of the system is to furnish **managerial statistics** and to ascertain if the company is realizing the expected profit on each class of products. (Fig. 1.)

Factory Unit Type of Cost System.—A **modification of the class cost system** is the "factory unit" basis under which all products are grouped into **weighted classes,** the weight factor in all cases representing the degree of difference in making the article as compared with the standard used. The total operating

cost of the department is divided by the total number of compound "factory units" produced during a month, and the unit cost for each class is determined by multiplying the average unit cost of the compound factor by the class factor. The direct material cost is omitted from the calculations and is determined on an arbitrary or estimated basis.

Fig. 1. Monthly Cost Sheet Used in Class Type of Cost System

PROCESS TYPE OF COST SYSTEM.—The process type is the **simplest form of cost system** because it consists of dividing the total expenditures by the total units produced, as shown in Fig. 2. It can be used effectively when the final costs of the product can be expressed in units of quantity, such as tons, barrels, hundreds and the like. This type prevails in chemical plants, moulding departments of foundries, galvanizing, various types of mining, certain types of pipe production, stone quarries, newsprint production, cloth production, oil refining and certain types of steel and iron mills. The costs should be analyzed by major operations, by departments and by different types of materials. Under this type of cost system, monthly physical inventories are usually taken to prove the costs.

The **most troublesome feature** of this type is the **proper treatment of by-**

products which are an important factor in many industries using this system. No definite rule can be laid down for the treatment of by-products because the character of the items varies with the conditions and customs which prevail within the business or industry. By-products may be sold without further handling; they may be processed into salable products; or they may become raw materials of subsequent operations. Under good accounting practice the costs of the main products are credited with the fair market value of the by-products. In other cases, where by-products are sold, the income realized from the sale of the by-products is considered as a miscellaneous income item and not a credit to costs. When additional labor is expended on by-products

to put them into marketable condition, all additional costs should be charged to the by-product, and when the by-products are processed into finished goods the market value of the by-products should be treated as a part of the material costs of the product.

In the process type all **wastage and spoilage** is absorbed in the cost of good production. For managerial purposes, however, it is advisable to provide waste reports showing an analysis of the kind, quality and quantity of waste.

PRODUCT TYPE OF COST SYSTEM.—The product type of cost system may be considered as a **modification of the class type** in which each product is a class. In the product type no attention is paid to individual order numbers because all elements of cost are charged directly to the product's name or symbol. This type of system is applicable to nearly all **companies manufacturing a regular line of products.** It can be used to advantage in industries manufacturing standard catalogued lines of goods and making the same parts over and over again. It avoids the difficulty of isolating the individual production orders for identical products continuously in process. It has been found advisable in some instances to discontinue the use of production order numbers and to control both costs and production on a monthly basis.

When the product type of cost system is used, the fluctuations in the work in process inventory are frequently ignored and **long-time average costs** are used in determining managerial policies and decisions. Where the materials involved are of sufficient value, a progressive record is maintained whereby the materials are transferred from one group of operations to another and the waste determined for each group. This method is particularly valuable where there is considerable spoilage or defective work upon valuable materials.

An example of the application of the product type of cost system under conditions where it is desirable to know spoilage is in the watch industry. The method of treating the costs under these conditions is best illustrated by the summary shown in Fig. 3, in which the figures used are for very small quantities for the sake of simplicity, although in actual practice the quantities handled are usually very large.

The most important point to be considered in this illustration is the **absorption of labor and overhead loss** on all preceding operations which have accrued at the time the articles are spoiled—for example, on the fifth operation. By dividing the total cost of this fifth operation by the quantity finished good at that operation, the cost for that operation is obtained, including the absorption of the loss on that operation. It is then necessary to absorb the labor and overhead loss for all preceding operations on the parts spoiled. This is done by multiplying the number of pieces spoiled by the **cumulative unit cost for the preceding operation,** thereby arriving at the unit labor and burden loss on the spoiled pieces for all preceding operations. The total labor and burden loss on all defective work throughout the group of operations, divided by the final good production at the last operation, gives the labor and burden loss to be applied against each unit finally finished. This loss added to the total cumulative unit cost equals the total labor and overhead unit cost for the finished production, including the absorption of all labor and overhead losses. To this is added the unit material costs, determined by specification, in order to arrive at the total unit factory cost. The direct material cost is usually determined by applying standard waste percentages which are verified from time to time by the accumulation of waste as shown on the product cost card. In some instances special studies are made to determine the waste percentage. This is sometimes done by accumulating and carefully weighing or counting all waste produced within a given department.

Fig. 3. Cost Card in Product Type of Cost System

The percentage of loss for material is arrived at by considering 23 defective against 75 finished goods. The fact that more pieces were finished in the fourth operation than in the third illustrates the lay-over of material. In a product cost system, the operation is considered only, as there are no order numbers to distinguish various groups. The number of pieces finished and the number found defective in all operations form the basis for the calculation of unit costs.

In the above-mentioned illustration, inventory fluctuations are ignored because of the expense involved in determining the actual inventory, and also because of the comparatively small fluctuation in the actual amount of work passing through the shop at any time. Long-time averages are used, thereby averaging out inventory differences. In fact, with a system of this type, it is customary to draw off the costs only from time to time to verify the so-called **standard costs** which have been adopted and which usually are used for an entire year without variation.

Such a system gives very good comparative data with a minimum amount of clerical expense, and furthermore, the system is so flexible that it can be operated to such degree of completeness as conditions warrant. The **current control** as to whether products are going through as efficiently as they should, can be exercised by watching **daily or weekly departmental production reports.**

OPERATION TYPE OF COST SYSTEM.—The operation type should be used where the difference in cost in performing an operation does not vary greatly between the different products worked upon, and where a large variety of products pass through similar operations. This method can also be used effectively where the direct material does not change appreciably during the operation, and in those industries where the direct material cost is determined by specification or bill of material. It can, however, also be used where the direct material does change during the operation, and where there is considerable spoilage, provided a proper mechanism is established for obtaining material costs separately from the operating cost.

The operation type has a **wide application. Unit costs** are found by dividing the total labor and expense of operation for a given period by the total number of units passing through the operation. Unlike the process type, only one or two elements of cost can be divided by the same unit. Sometimes it is labor only; other times labor and overhead. Direct material is seldom a factor, because operation costs are used principally in cases where little or no material is added during the operation.

While the operation type of cost system is sometimes used for an entire industry, it is more commonly used for the costs of certain groups of operations. It is applied to operations which are relatively inexpensive per unit of product, and in which the workers change frequently from one product to another, or work on a number of different products at short intervals.

Ordinarily the operation type does not distinguish between direct and indirect labor or material, except for managerial purposes. It is concerned chiefly with the total labor involved in an operation and the supplies incidental to that operation. The operation is usually charged with its proportionate amount of power, supervision, and the like, and in effect it absorbs its proper share of overhead.

EXAMPLES OF OPERATION COSTS.—An example of the operation type of cost system is one used in the manufacture of **fishing reels,** which requires a series of operations during which the gears are ground together until a satisfactory smoothness of operation is secured. The length of time required to grind-in a set of gears varies considerably in any one grade of reels, and different operators work on all grades of reels at the same time. They work in such a manner that it is impossible to allocate their time to the different reels. In these operations no materials are added to the product. Consequently the direct material item is not a factor in the determination of costs.

In this case the total cost of the gear grinding department for each month is divided by the total number of good reels finished, to determine the average

cost of each for the gear grinding operations. In the final cost calculation only the total unit cost for gear grinding is used, but for managerial purposes the cost of grinding is **completely analyzed on a comparison basis,** showing the labor, supplies, maintenance, etc., applicable to each of the operations within the group. This statement provides the management with information re-

Fig. 4. Cost Sheet for Operation Type of Cost System

This Assembled Cost is made up from individual operation costs for "Curing," "Trim," etc. The unit operation costs for the first two operations are taken directly from time tickets charged by tire sizes. The balance of the operation costs comes from the cost sheets as shown by previous sample, there being one of those for each operation. The parts shown under "Material" as Side Walls, Treads, etc., are first costed on cost sheets similar to the above, and then the monthly unit cost results used as under "Material" on the tire cost sheet. The parts are costed using "operation" costs for compounding, calendering, etc., which operations apply only to the parts and not the tire as a whole.

garding the number of reels finished and the average cost of such reels, together with sufficient detail to determine the cause for any exceptional increases or decreases in the number of reels finished for a given expenditure.

In this particular instance the operation type of cost system was used instead of the class type, because there was not a sufficiently great variation in the quality of reels made to warrant a segregation into different classes. It is

apparent from this illustration that the main distinction between the operation and the process type of cost system is that direct materials are an important factor in the latter, and are not even considered in the former.

Another illustration is the "curing" costs in the **rubber tire industry.** The total costs of curing cord and fabric tires are compiled separately, and each total is divided by the number of tires of the respective kind cured during a given period, thereby arriving at a "curing" cost per tire. In this industry the operation type can be used generally, and direct material costs are determined largely by specifications.

The operation type of cost system can be used, because of its nearly **universal adaptability** to specific problems, in practically any industry or business. Fig. 4 illustrates a form of cost sheet for the operation type of cost system.

COST ACCOUNTING NOT AN EXACT SCIENCE.—Cost accounting is not an exact science and the exact cost of a manufactured article can seldom be obtained. The effort, therefore, should be to see that the cost accounting routine is executed intelligently so that **reasonably correct figures** may be secured. Any endeavor to be meticulously exact is likely to delay and obscure needed information. The cost of many items must be based upon close estimates which are accepted as substantially correct, and a considerable part of the cost is made up of overhead expenses which must be distributed to the product upon some general basis. It is much more important to have the cost accounting directed and supervised by one who has had sufficient practical experience to detect and adjust misleading cost figures that may result from clerical errors than to have a cost department head who lacks the practical viewpoints and who consumes considerable time and energy in trying to secure exact computations on relatively unimportant items.

NECESSITY OF COST INFORMATION BEING CURRENT.—One of the main requirements of a good cost system is that it should furnish cost figures promptly. It is sometimes advisable to sacrifice a certain amount of detail if necessary, in order to speed up the preparation and presentation of the cost figures. The **most useful cost figures** are those which are prepared daily or weekly, because if such figures indicate uneconomical shop conditions immediate corrective action may result in substantial savings. Cost figures which are prepared and submitted long after the production operations have been completed are of historical value principally. It is difficult for the shop executive to recall the operating conditions which existed at the exact time that such an order was passing through the factory.

SELECTION OF COST DEPARTMENT HEAD.—The selection of a capable acting head for the cost department is really **of greater importance than the selection of the system.** The most carefully designed procedure will fail if it is not operated with intelligence and vision. Too often the person responsible for the cost accounts is of the mechanical type or one who lacks an understanding of practical operating features and fails to appreciate the purposes for which costs are ascertained and used. Such a person has but little conception of the best form of presenting the cost results to the management. The collection and presentation of cost figures is so important to the intelligent conduct of a business that every effort should be made to secure the best ability available for the management of the cost department.

USE OF STANDARDS.—Cost figures in themselves have but a limited use. Hence provision should be made for **comparisons of actual costs with carefully prepared standards.** Standard costs may be predetermined from an intelligent study of the present and prospective operating conditions and a

review of past experiences. Standard costs are used as a gauge to determine whether the actual costs are over or under expectations. Comparisons of the actual costs of various periods are inconclusive because, as a rule, no definite explanation of the variances between such costs is possible. With well determined standard costs the variances between the anticipated and the actual accomplishment are apparent and attention is focused promptly upon the factors which have caused the differences and should be investigated.

DEPARTMENTALIZATION IMPORTANT.—The departmental division of the plant is a deciding factor in determining the type or types of cost system to be used, because practically all costs originate in the departments. It is frequently found that a type particularly applicable to one department cannot be used advantageously in other departments. For example, it may be found advisable to install a special order type of cost system in the machine shop, a class cost system in the foundry and in the hardening and plating department, a process method in certain auxilliary departments, such as wire drawing or the melting and refining of metals. The nature of the departmental operations will indicate the most appropriate type for the departments.

CONSIDERATION OF CLERICAL WORK.—Another real factor in the selection of the type of cost system is the **volume and expense of clerical work.** One type may provide very comprehensive cost data of limited practical use. Too often the theoretical desirability of having certain information is accepted without question and without practical investigation of just how the information can be used effectively in controlling and reducing costs. The financial manager of a business should be "hard-boiled" when cost systems are discussed. There is nothing sacred about any one system. Many successful manufacturers have become so impatient over the delays and expense of the system in their plants that they have scrapped the cost department *in toto*. If a cost system cannot justify itself without argument, an investigation is in order.

Accounting for Labor

In accounting for labor in a factory, **three main considerations** must be kept in mind:

1. The accumulation of proper data by which the various workmen can be paid the **wages** which they have earned.
2. The accumulation of data whereby **direct** and **indirect labor costs** may be compiled in accordance with the requirements of the type or types of cost system in use.
3. The accumulation of data **for accounting purposes** whereby the control accounts in the general ledger may be debited and credited in the proper distribution of the payroll.

CLOCK CARDS.—The **basic record** in accounting for labor is the time book in construction work, and the in-and-out clock card in factories. These records are provided to record the exact time the worker spends in the plant.

TIME CARDS.—The next most important record in accounting for labor is the time or job card which is provided as a means of analyzing and distributing the total time recorded in the time book or on the in-and-out clock card. There are innumerable forms of time cards but fundamentally they are merely a means for recording the **actual time spent by each worker on each particular job** or phase of work. The time cards are used frequently as reports of the number of pieces worked on; the number of good pieces finished; the number

proved to be defective; the machine and operation worked on; the department worked in, etc.

LABOR DISTRIBUTION SUMMARY.—Another record necessary in the accounting for labor is the summary of **direct and indirect labor by departments.** This record forms the basis for the journal entries whereby the payroll account is credited and the various departments are charged with the proper proportion of indirect labor, and the work in process accounts are charged with the proper amount of direct labor.

PIECE-WORK RECORD.—A fourth record which sometimes is very important in accounting for labor is a piece work slip on which the actual production of a worker is recorded and approved by an inspector or foreman. Sometimes such data are included directly on the time cards above referred to.

ROUTINE PAYROLL AND COST PROCEDURE.—All time cards should be checked with the in-and-out clock cards, either daily or weekly, so that the total time recorded on the controlling record of the clock cards is properly analyzed and accounted for. After proof with the clock cards the time cards should be summarized by direct and indirect labor, and by departments, to provide summarized figures for use in making necessary journal entries. It is customary to post the time cards to the **permanent payroll records.** After the time cards have served their purpose in the preparation of the payroll and the monthly summaries, they should be sent to the cost department. The exact method of handling the forms varies considerably in different industries, and even within one industry, depending upon the views of the person directly in charge of such work. Sometimes the labor costs are accumulated from the time cards on distribution sheets, from which they are distributed directly to the cost cards.

Wage rates and piece rates are usually applied in the payroll department, which also extends the time at the proper rate in order to determine the total pay due each worker. This information, summarized in a different manner, is also used by the cost department in accumulating the costs. **Labor distribution sheets** are used particularly in construction work and in process industries.

The distinction between direct and indirect labor is merely arbitrary. The shop ordinarily distinguishes between direct and indirect labor in accordance with the nature of the work being done. However, the cost distinction between direct and indirect labor is an entirely different matter and is based on costing conditions. For example, in the terminology of the shop a workman stamping numbers on products would be considered a direct worker because he is working directly on the product. From a cost accounting point of view such a workman would very probably be considered an indirect worker, because he changes so rapidly from one product to another that it would be impracticable to attempt to split his time between the various orders or products, and it is, therefore, thrown into overhead. In a process cost system or an operation cost system, the distinction between direct and indirect labor is not necessary for costing purposes, but it is made for managerial purposes on the basis of ordinary classifications for shops.

LOANED WORKER.—In most factories it is customary to assign workers to a certain department, which may be regarded as their **home department,** and it is desirable to give a worker only one pay envelope, under the jurisdiction of his home department. Various cost accounting procedures have been developed to account for **transfers of direct and indirect workers** from the home department to a department to which the worker has been loaned. In some cases the

overhead of the home department is applied on work done by indirect workers in other departments. This is particularly true with **maintenance workers** whose work in such cases bears the overhead of the maintenance department. The workers' payroll records should be accumulated under the home department heading, and be distributed in the cost records to the various departments affected. A **payroll sheet** is shown in Fig. 5. The **payroll summary** which is used for journal entry purposes must show the distribution of transferred labor.

Accounting for Materials

STORAGE.—Material control is a very important factor in practically every manufacturing or construction activity. Materials should be systematically stored in well arranged storerooms or yards under the jurisdiction of authorized storekeepers. In **manufacturing establishments** it is customary to have separate storerooms for supplies, raw material, finished parts, sub-assemblies, finished stock, etc.

STOCK RECORDS.—The amount and value of the stock in the storeroom should be recorded in stock records, and the records should be controlled by accounts in the general ledger. No goods should be received in the storeroom without notification to the stock records clerk by means of a receiving report or some other suitable form. Goods should be issued from the storeroom only on a **signed requisition,** which is transmitted to the stock records clerk for posting on the stock cards.

The stock records are not merely accounting records or cost accounting records, but are also used by the production and the purchasing departments. They are sometimes maintained **on a quantity basis** only, but in most modern installations the **unit prices or costs** are entered also on the stock records. It is now generally recognized as **poor practice** to have the stock records kept in the storeroom by the storekeeper. **Modern procedure** places them in the general office for the convenience of the production, purchasing and cost departments, and as a check on the storekeeper. The storekeeper's function is that of proper physical segregation and care of stock and the receiving and issuing of materials upon the proper authorization as shown by recognized forms of receiving reports or issue slips. Good storekeepers are often very poor bookkeepers.

STOCK CARD.—The basic record in cost accounting for materials is the stock card (Fig. 6). The actual form of card or sheet will vary considerably with local conditions, and is of relatively minor importance as compared with the proper enforcement of a well laid-out plan for controlling materials. It is customary to have a separate stock card or sheet for every item of material in a storeroom. The simplest and most popular form of stock record, although criticized considerably in recent years, is provided with columns for showing only **receipts, disbursements** and **balance** of stock on hand at any one time. Sometimes cards of this type are provided with Price and Amount columns. Some of the more modern stock cards are provided with columns for recording goods ordered, requirements for orders received, and materials appropriated to various orders. It is customary to have subheadings under each column for dates, order numbers, quantities, prices, and amounts.

RECEIVING REPORT.—The receiving report is an essential record in the accounting for material. This serves as an automatic notice to the stock record department of the quantities and prices of the goods received. The receiving report should show the **location** of the goods and any **transportation charges**

which have accrued thereon. Sometimes the receiving report covers quantities only and is accompanied by an invoice which gives the necessary cost information. The unit price applied to the stock records usually includes transportation charges.

REQUISITION.—The third most important record involved in controlling the materials is the requisition or issue slip, which is the authorization for the withdrawal of material from stock. In all cases the issue slips should show the **order number** to which the goods are to be charged when issued, an exact **description of the material** to be withdrawn from stock and the exact **quantity** issued. A provision should be made on the material requisition slip for inserting unit and total prices to show the amount or value of the goods delivered from stock. All material issue slips or requisitions should be **signed by an authorized person,** such as the foreman or production manager.

The **material credit slip** is practically a copy of the requisition. Different colors are used to help make a proper record of the return of materials to the stockrooms from the factory.

Bills of Material.—Bills of material or material specifications are coming into more prominent use as material requisitions, because their use eliminates the clerical work entailed in the copying of a large number of items on individual requisitions. Different materials from one stockroom may appear on one requisition, but it is seldom good practice to place items on one requisition for more than one production order. This is true regardless of the type of cost system used.

Indirect Materials.—All issues of indirect materials or supplies are charged to the departmental overheads or to various expense accounts rather than to production orders.

LOT METHOD OF ISSUE.—When prices are maintained on stock records, it is customary to have the stock record clerks enter the correct prices on the material requisitions at the time they post the issuance of materials to the stock records. The most accurate way of applying prices is on a lot basis. That is, if 1,000 pieces have been received in stock at a price of 10 cents each, and another lot has been received subsequently at a price of 15 cents each, the 10-cent price will be used until 1,000 pieces have been issued. Subsequently the 15-cent prices will be used until another 1,000 pieces have been issued. In some instances, however, the use of **average costs** instead of lot prices is preferable. A modern development in the pricing of requisitions is to use **standard prices.** In such cases it is necessary to accumulate the actual cost in order that the differential between actual and standard may be determined and applied accurately every month.

RUNNING TOTALS.—Some cost accountants advocate the use of running totals on stock records instead of balances. The theory of this practice is that information such as the **total received** and **total issued** since a given date is more frequently required than the balance on hand. Furthermore, the clerical work in obtaining running totals is simpler than the continuous subtraction which is necessary in obtaining balances. Either method may be used, depending on the local conditions encountered and the likes and dislikes of the executives using the records.

DUAL PURPOSE OF RECORDS.—As in accounting for labor, the basic records controlling the flow of materials through a factory, such as the receiving report and the material requisition, serve a dual purpose in that they must be used for both **cost purposes and for general accounting.** The requisitions

should be summarized on accumulation sheets to provide a basis for the proper journal entries in the general accounts at the end of the month, after which they should be sorted by order number, product, operation, etc., for cost purposes.

The general practice is to charge the cost of special materials directly to overhead or other appropriate accounts rather than put them through the storerooms and stock records. In some companies, however, the definite practice of putting all materials through storerooms even though the materials may be specially ordered for maintenance purposes is established.

In many cases it is not considered advisable to attempt to control certain classes of materials in the customary manner. For example, boxes and shooks, shipping lumber and certain types of miscellaneous supplies are frequently charged off to expense as received or, if the cost is relatively great, the amount to be charged off is prorated over a given number of months, usually depending on the estimated length of time it will take to use up the materials.

MATERIAL CONTROL SOMETIMES DETAILED.—While the correct control of materials has been generally neglected in manufacturing establishments, certain companies, on the other hand, have gone too far in attempting to control materials. This is particularly true in some of those industries using materials of relatively low value and in small quantities per order. An advantage of the class type of cost system is that materials can be charged to the various classes in relatively large quantities, thereby greatly simplifying the clerical work involved and yet providing a correct analysis of costs.

It has been found advisable at times to forego a detailed accounting of the material, even though the material is of considerable value, because of certain physical difficulties. In textile industries, for example, especially in weaving silks, serious obstacles in obtaining correct detailed accounting control of materials are encountered because the weights of the materials vary with the humidity in the air and the actual weight of the silk on the spools and bobbins must be approximated by deducting estimated weights of the spools and containers. Such complexities are often understood imperfectly and ridiculous cost results are obtained with the ordinary type of detailed inventory control. This problem has been solved by carefully estimating the quantity of raw material required to make each order of finished goods, and by keeping an accurate record of the aggregate of materials used as compared with the materials called for by the estimate. This method at least gives an accurate determination of the over- or under-absorbed raw material costs, and therefore, provides a guide to determine the effectiveness of the estimating department.

The main function of the **estimating department** is to provide prices for the selling department. The cost department checks the estimating department. When such a system is used, it is difficult to prevent theft by means of accounting records because of the physical difficulties already spoken of. The best solution of the theft problem is good supervision and watchman service. In the handling of **precious metals** it is customary to charge the workmen with the full value of the metal issued to them and to require them to return approximately the same weight in the form of finished work, scrap, unused material, etc.

It is customary to charge off **office supplies** and supplies of a similar nature in fairly large quantities, and then issue such materials in small quantities as needed and without the use of requisitions. In such cases good supervision is far more effective than an attempt to maintain detailed accounting records over materials of such small value. This is particularly true where the ultimate consumption of the materials is in small units.

PHYSICAL INVENTORIES.—Stock records should always be verified by periodical physical inventories. In the ordinary manufacturing establishment this is done once a year, preferably at the end of the fiscal period. When possible, the date of closing should correspond with the time of year when inventory stocks are at their lowest.

In some instances methods are employed whereby the stock records are **continuously verified.** This may be done by a group of men who do nothing but continually check stock and correct differences on the stock cards where necessary. The work is usually so laid out that the stock checkers can cover the entire inventory in a given period such as 6 months or a year. In other cases it is customary to have the storekeeper report the balance of stock on hand on every requisition coming through, which automatically notifies the stock clerk of the exact amount of material remaining on hand and thereby enables him to verify or adjust his stock records. Any substantial unaccounted-for differences should be reported to the accounting executive.

The most important thing about the taking of a physical inventory is **planning and organizing** for the work. Instructions should be compiled showing who shall be responsible for the inventory, what shall be taken, how it shall be classified, how it shall be taken, how it shall be priced, etc. When **differences in inventories** are discovered, it is necessary to maintain a record of adjustments in order that proper journal entries may be made. This is sometimes done directly on the individual stock record cards, in other cases on separate records, and sometimes on summary sheets placed with the stock cards, one sheet for each group of stock cards in accordance with the accounting classification. Adjustments should be charged or credited to an inventory adjustment account, the proper offsetting entries being to the proper inventory control accounts. A **trial balance of the stock cards** should be made from time to time so that they balance with the controlling accounts in the general ledger.

SCRAP AND DEFECTIVE WORK.—In some industries scrap and defective work must be given careful consideration. Defective material received from the vendor should be returned to the vendor or repaired at the vendor's expense. Scrap is generally divided into two classes, avoidable scrap and unavoidable scrap. **Avoidable scrap** may be caused by an operator's carelessness, by errors in drawings, defective tools, obsolescence, etc. **Unavoidable scrap** may be considered as borings, turnings, waste, sweepings, punchings, certain types of obsolete materials, and worn out materials and equipment. Many industries maintain **salvage departments** for the purpose of recovering scrap and correcting defective materials to the best advantage. In some cases the accounting is handled by charging all scrap materials and salvage labor and expense to a **scrap account,** which in turn is credited with the sales of scrap materials, and with the original cost value of materials which have been restored to full usefulness. Any balance in the account is absorbed in the profit and loss account at the end of the year.

In most factories it is considered advisable to **label all scrap** or rejected materials with tags of a distinctive color. If a special order cost system is used, the scrap or salvage tickets should show the order number, the quantity rejected, the reason for rejection, etc., and a copy of the tag should be turned into the cost department. In some factories salvage work is only undertaken when authorized by a special salvage order.

Production orders are sometimes credited with the scrap produced on the orders, particularly in stamping irregularly shaped pieces out of sheet brass, sheet aluminum, etc., where the scrap metal is a material factor in the cost. In rare instances the scrap is credited to production orders at original cost

alue. However, in general practice the credit is on the basis of current scrap alue of the materials turned back to the stockroom as scrap. With the exception of automatic screw machine products, borings, turnings, and the like are ot valuable enough ordinarily to be credited to production orders. Sales of uch scrap may be cleared through a scrap account, credited to overhead, or aken as miscellaneous income. The problems which arise in connection with ccounting for scrap are innumerable, but one important point to consider is he proper **clearing of the work in process accounts** and the various stock ccounts in the treatment of scrap, particularly when materials are declared bsolete, or an excessive supply is disposed of by direct sale.

Where **assembly costs** are built up from standard unit part costs, it is ecessary to provide for the absorption in the cost of pieces spoiled in assembly, nd replaced from stock. If too much detail is involved to permit the charging f replacement parts direct to the products or orders, all defective parts may e segregated and tabulated at the end of the month. The total value of the lefective pieces at original cost should be determined and total cost should be harged to a special account which may be called a **"replacement" account** and vhich preferably forms a part of the overhead in the department under consideration.

STORAGE CHARGES.—Usually it is impractical to distribute storage harges over the materials stored upon the basis of weight or values. Such harges are more conveniently handled by including them directly in overhead. **nterest on investment** is not ordinarily considered a proper item of cost in ccounting for materials.

MAXIMUM AND MINIMUM STOCKS.—In order to insure an adequate upply of standard parts and yet not tie up too much money in stock, it is dvisable to set maximum and minimum limits on all stock items. Whenever he stock on hand reaches the minimum, the stock clerks are instructed to put hrough a purchase requisition for more parts. The limit of amount to order is ndicated by the maximum which has been established for the goods under onsideration. An historical record of the goods consumed in six months or nnual periods should be recorded on each stock card in order to provide a asis for determining the maxima and minima. Maxima and minima should ppear on each stock card for convenience in reference.

In **establishing maxima and minima** it is necessary to consider the length of ime required to secure the goods either from vendors or from operating departments, the probable supply required to meet production, the economical quantities to buy or produce, and finally the storage facilities. The establishment of he proper minimum is particularly important where the article under consideration is used in a large number of different products. The maximum and ninimum requirements should be subject to **frequent revision** to conform to arying conditions.

EQUIPMENT RECORDS.—Small tools consumed in operations and generally called **perishable tools** are usually included in the supply inventory and re controlled by means of stock records in the ordinary manner. However, **achinery and equipment** should be analyzed with the aid of a **plant ledger** vhich discloses the original cost of each machine, the cost of installation, of ll additions, major repairs, etc. Such records are valuable as a basis for guring depreciation and particularly as a basis for calculating fire losses. In ome modern factories a complete set of plant record cards are maintained and sed to study and reduce the cost of maintenance.

The **plant ledger cards** are comparable to a cost card in that all labor and

materials used for **repairs and maintenance** are currently posted to these cards in order that a comparison may be made between the cost of maintaining machines with different types of operators and between the amount of maintenance required for machines of different makes but of the same type, etc. The ledger is also valuable in providing data whereby the profit and loss on the sale of old or excess equipment may be determined. If different **rates of depreciation** are used on different machines, the depreciation charged off in cost accounting should appear directly on the plant ledger card so that the exact residual value of the machine may be determined at any time. The plant ledger cards are controlled by accounts in the general ledger for machinery and equipment, and they should be balanced from time to time with those accounts. Care must be taken to see that the control account is properly adjusted when machinery is either bought, sold, transferred, or abandoned, and that the depreciation account is properly adjusted so as to eliminate the depreciation on the machines disposed of and to add depreciation for those acquired.

Factory Overhead

FACTORY OVERHEAD.—**Overhead** or **burden** is a general term ordinarily meaning the accumulation of indirect production expenses. **Departmental overhead** or burden is the indirect costs which may be directly allocated to operating departments, such as departmental supervision and clerical help, cleaning and sweeping, departmental tool room, labor, departmental maintenance, and supplies. **Expense** is a term ordinarily applied to those indirect costs which cannot be directly allocated to the operating departments, but which must be accumulated separately and prorated to the operating departments. Expense is ordinarily made up of such items as general supervision, inspection, receiving and shipping, power, light, heat, general maintenance, elevator service, water and gas. The term **"fixed charges"** is applied to certain items which come under the general heading of expense, and ordinarily refers to such items as depreciation, insurance and taxes.

DISTRIBUTION OF OVERHEAD.—The most vital part of any cost finding method is the proper allocation of the overhead expenses. The indirect or overhead expenses are often greater than the total cost of the direct materials and labor. Therefore, an arbitrary or unstudied distribution of the overhead expenses tends to nullify the large volume of careful detail work which is involved in compiling the direct material and labor costs. Most of the dissatisfaction with costs arises from a failure to distribute overhead properly. In general, overhead expenses should be segregated to various departments of the plant and then applied to the costs of the products which pass through the departments by the use of one or more departmental burden rates.

The **most common method of applying departmental overhead** to costs is as a **percentage of the direct labor costs** of the article. There are many cases, however, where this basis is not properly applicable, and **other methods** such as the rate per direct labor hour, the total direct and indirect labor costs, the machine hour rate, the gang rate and others, are used. The best methods of applying the overhead expenses to the product can be decided upon only after a survey of the existing operating centers, and the physical arrangement and equipment of each department and a study of each item of overhead expenses. Direct department expenses should be charged to the department affected and general expenses should be spread over all departments in an equitable way.

Departmental overhead rates can be obtained often as simply and with prac-

tically the same clerical expense as flat average overhead rates. The same work must be done in both cases, and the determination of departmental overhead is merely a matter of the subdivision of the data accumulated.

In determining departmental overhead rates it is very important to consider the **departmentalization from the costing point of view.** An existing departmentalization which has been made primarily for supervision, physical layout, and other operating considerations, may not be suitable for costing purposes. For example, an assembly department and a machine department may be considered as one department, but for costing purposes such a department should be divided into two departments, because the actual overhead rate on the direct labor in the assembly department will be less than the overhead rate in the machining department. Maintenance departments grouped for practical reasons with operating departments should be segregated for cost purposes.

Departmentalization should not be carried too far. It should be based on practical consideration rather than theoretical distinction. From the cost point of view, the basis of departmentalization should primarily be one of grouping together those functions and elements in the general scheme of production which are of such a nature that an arbitrary distribution of overhead can equitably be made on some basis to all products passing through a department. It is very frequently quite practicable and advisable to group together a considerable number of physically separate departments. For example, in one very large factory it was found that the relative length of time required for the products to go through the processing and the assembling departments were practically constant and therefore an overhead rate for the manufacturing departments and a rate for the assembling departments were all that were necessary.

ACCUMULATION OF OVERHEAD.—In accumulating overhead at the end of the month, it is usually best to distribute first the supervision and indirect labor to the proper departments. This can best be done in a practical way by assigning so-called **standing order numbers** to cover all classifications of indirect labor and expense. Indirect time tickets, after having served for payroll purposes, can then be sorted and filed away by standing order numbers, summarized at the end of the month and posted to the overhead work sheets by departments. Indirect materials can then be summarized by standing order numbers in the same manner and posted to the work sheet.

METHODS OF DISTRIBUTION.—The most common method of absorbing overhead into costs is to apply it as a percentage of the direct labor cost. While this method is most widely used, it is less accurate than an application upon the basis of a **flat rate per direct labor hour.** When the percentage of labor cost is used, highly paid skilled workmen carry more overhead than the lower paid unskilled workmen, notwithstanding the fact that the unskilled man actually consumes much more overhead in carrying on this work because of inefficiency of operation, larger amount of time and supervision needed, and greater spoilage. Overhead is sometimes absorbed on the basis of the **machine hours charged.** Under a modification of this plan, a general overhead is applied on a **departmental basis,** supplemented by a so-called super-charge for the use of certain machines or groups of machines.

DEPARTMENTAL BASIS ESSENTIAL.—Overhead should be applied on a departmental basis, because in most factories overhead percentages will vary considerably in different departments. The departmental variations affect true costs, unless all goods spend an equal amount of time in each department. If some goods skip certain departments, or spend a disproportionate amount of

time in other departments, the application of an average factory overhead rate will produce erroneous costs. For example, a factory may have two departments of equal size, with overhead rates of 150 and 50% of direct labor respectively, or a factory average overhead rate of 100%. Assume that in the processing of the product, product A takes twice as long in the first department as in the second department, and product B takes twice as long in the second department as in the first department. If the total direct labor costs on both A and B are the same, the total cost of each product, using the general factory overhead of 100%, will be the same. However, if the departmental overhead rates are used, it is apparent that the cost of B will be greatly in excess of A, because B spends twice as much time in the more expensive department.

Ordinarily there are certain **indirect materials** which are charged directly to expense and which are not put through the stock records. A convenient way to be sure that such expenditures are included in the overhead is to have the accounting department make out a so-called **expense debit slip** for all such items, giving the standing order number, the nature of the material or service purchased, and the amount. These slips can then be filed with the material requisitions and be entered on the overhead work sheet.

Special standing orders should be provided for all **items of maintenance.** Maintenance charges consist primarily of indirect labor, indirect materials and expense charges, and consequently are posted on the overhead work sheets. Whenever maintenance work is covered by separate individual orders, care must be taken that such orders are properly closed and included in the overhead compilation.

DISTRIBUTED EXPENSES.—The established departments should be charged with their proper proportion of depreciation, insurance, taxes, etc. **Depreciation, fire insurance and taxes** should be apportioned on the basis of property values, and **liability insurance** should be distributed on the basis of the payroll.

In most factories there are at least two general service departments, viz.: power, light and heat, and general expense. These may be subdivided into the power departments, the engineering departments, the superintendent's office, etc. These departments should receive their proper share of all items of indirect cost. Before the overhead of the operating departments can be determined, it is necessary to close and distribute the overhead of the power, light and heat departments and general expense departments. A departmental burden statement is shown in Fig. 7.

The columns or sheets for power, light and heat and for general expense are then summarized in order to determine the totals which must be distributed. Power, light and heat are distributed to the operating departments on the basis of their actual consumption. In large plants meters are used sometimes to determine an accurate distribution, but a more common practice, which is the result of necessity, is to have the engineering department make a practical estimate of the distribution of these items.

DISTRIBUTION OF GENERAL MANUFACTURING EXPENSE.—General manufacturing expense should be distributed to the operating departments on the **basis of total payroll,** because the items entering into general manufacturing expense fluctuate more with total payroll than with any other one factor. Some companies use total direct labor costs as a basis for the distribution of general manufacturing expenses, but in most cases the total payroll basis is more satisfactory.

After all the expenses have been distributed to departments, the departmental

overhead rates can be determined. Journal entries may or may not be involved in the distribution of the charges of the service departments, depending upon the nature of the control accounts in the general book.

Standards

STANDARD AND NORMAL OVERHEAD RATES.—In modern cost accounting practice standard rather than actual overhead rates are applied in the costs. Predetermined standard overhead rates are used because it is necessary to cost orders before the actual overhead rate is known, and an overhead rate representative of average normal conditions is more reliable for price setting than the fluctuating monthly actual rates. The predetermined overhead rate also provides a definite basis of comparison with actual, and it can be used effectively by the management in controlling and reducing overhead. It is now a general practice in modern industries to provide the foremen with monthly statements of the overhead of their departments in order to secure their interest and assistance in the reduction of such expenses. When standard overhead rates are used it is important to determine the difference between the actual overhead and the total overhead absorbed in the costs at standard rates. The difference between the standard overhead absorbed and the actual overhead is then shown as **over- or under-absorbed overhead,** and is carried directly to profit and loss. For managerial purposes it is advisable to provide a table at the bottom of each overhead statement showing the actual overhead percentage for the month and the average percentage to date compared with the standard. The overhead statements can be used as a basis for journal entries in which work in process is charged with overhead at standard rates and a control account called "overhead absorbed" is credited. The actual overhead must tie in with the control accounts for overhead in the general ledger. In the general ledger the difference between the Overhead Absorbed account and the Actual Overhead accounts must agree with the sum of the over- or under-absorbed overheads as shown by the various departmental overhead sheets.

With carefully prepared standard overhead rates the over- or under-absorbed overhead is a manufacturing profit or loss. It must be borne in mind that the cost of sales would be increased or decreased by the amount of over- or under-absorbed overhead if the actual overhead was used instead in compiling costs.

Standard overhead rates are usually determined on the basis of practical experience and past records. In some cases they are worked out scientifically on the basis of a normal capacity of 80 to 85% of the theoretical 100% capacity.

Actual overhead rates fluctuate with the volume of production because a large proportion of overhead is relatively fixed. For this reason standards are valuable, particularly in setting prices, because with a decrease in the volume of production and with charges relatively fixed, the percentage of overhead applicable to direct labor on an actual basis increases considerably. Under such circumstances, if actual costs were used, the selling price of the goods would have to be increased radically at the very time that they should be maintained at a relatively low figure in order to attract business. When business is usually good and the factory is operating at more than normal capacity, the actual and relatively fixed overhead per unit of production will decrease and be less than the standard. In other words, standard rates permit prices to be set on the basis of fair average normal operations and not on the basis of temporary or abnormal conditions.

Standard overhead rates should be changed as often as necessary. It is not customary to change them more than once or twice a year. Any change in

standard overhead rate should be made effective at the beginning of a month in order that the cost department may make a clear-cut application of the new rate in the cost compilations. The date on which the work was done should determine the rate to use and not the date on which the cost compilation is made.

A factor which must also be considered in changing standard overhead rates is the **inventory on hand** at the time the rate is changed. Care must be taken to see that the various inventory accounts are not charged with stock including one overhead rate and credited with deliveries from stock at another overhead rate. In other words, the change in overhead rates must not inflate or deflate the inventory controlling accounts.

DISTRIBUTION OF GENERAL EXPENSE ON STANDARD BASIS.—The use of standards has been extended by some companies to cover the distribution of the general expense to the various operating departments. This method of distribution is particularly **valuable when business conditions are irregular** and certain departments are operating at full capacity as against other departments which are practically closed down. Under such conditions if the entire actual general manufacturing expense is distributed each month, the departments which are operating at full time will be charged with an abnormally high proportion thereof and the departments which are practically shut down will be relieved of most of the general manufacturing expense charges. This situation can be covered properly by the use of standard rates which reflect the charge per direct labor hour or direct labor dollar under normal conditions. The over- or under-absorbed general manufacturing expense should be carried directly to the profit and loss.

UNABSORBED EXPENSES NEVER AN ASSET.—Instances are known where debit balances in overhead expense accounts have been carried as an asset instead of being transferred to profit and loss. The reason given, that increased production may take care of the unabsorbed balances, is wholly fallacious. The only justification for carrying any deferred expense as an asset is that there is a continuing benefit running to the succeeding accounting period. When production cannot absorb the actual costs of a period there may be a detriment running to the next succeeding period; certainly no benefit arises out of subnormal operations. The principle applies fully to seasonal businesses and any others where there is a hope that one period will take up the slack of another. **Fiscal periods** should be arranged so that normal and abnormal conditions will balance within the period. If they do not, a concern is out of luck. Operating deficits cannot be carried as assets unless executives choose to assume the responsibility for false balance sheets.

STANDARD COSTS.—The tendency among modern cost accountants is to use standards in costs. Some prefer using as their standard one which may be described as an **"efficient standard"** which is, however, largely theoretical and which is rarely equaled in actual practice. Others use **estimated costs** based upon previous experience, as their standard costs.

STANDARD OF EFFICIENCY.—The first type of standard cost is set up from an analysis of an exceedingly good past performance but generally from actual time studies made of individual jobs. **Separate standards** should be set for **labor, material** and **overhead;** and labor cost, material cost, and overhead cost should be set for each article manufactured. The actual costs are compiled and compared with the standard costs.

This type of system is used in a number of industries for the purpose of showing the differences between the actual and standard costs. In the use of this system the differences between standard and actual costs must be shown in work

in process finished stock and cost of sales. This involves the running of two sets of records, one on a standard basis and the other on the actual cost basis.

In the use of the above method some cost accountants do not carry the differences between actual and standard through all the control accounts. They show on each cost sheet the standard of labor, material and overhead, respectively, as against the actual.

STANDARDS WATCHED BY PRODUCTION DEPARTMENT.—Sometimes it appears from a study of the standard cost system in use that the attempt is made through the cost system to control something which might better be controlled by the production department. The time to watch and control differences between standard and actual in direct labor cost is while the job is progressing through the factory. Simple production plans are in effect in a great many manufacturing plants wherein **standard quantities per hour** are expected for each operation and these quantities are shown on copies of the shop orders going to the factory departments. In these plants it is the function of either the timekeeper, assistant foreman, or dispatcher, whatever he may be called (according to the respective system in effect), to note the **actual performance** of the work in quantities per operation per hour, etc., immediately after the work has started. At that time the dispatcher or timekeeper notes the actual production against the standard and calls the foreman's attention to any great deviation. If any remedy can be applied, the time to do it is while the work is in process, and not after the order is completed and general cost summaries compiled.

In the ordinary manufacturing plant it would seem sufficient for the cost man to content himself with standardizing the overhead. That is, after all, the one element which fluctuates directly with the volume of production, plant capacity, etc. The labor can be controlled through the production department and the material used may be generally controlled through engineering specifications or "bill of materials." Where the production department performs the function of production control it is only necessary for the cost accountant to watch the expenditures and ascertain actual costs, using, however, standard and predetermined overhead rates.

ESTIMATED STANDARD COSTS.—The second general class of standards, known as estimated standard costs, is coming into general use. In an industry where the same line of products is made over and over, it seems unnecessary to cost each shop order or production run for the same article. The variations in actual costs should not be great because the elements of direct labor, material and overhead in normal times are about the same.

Standard costs, or "estimates" as they may be more properly termed, should not be attempted until sufficient actual cost data on an order basis or product basis have been found from previous experience. Such estimated or standard costs can be set up only from past results. The **object of this method** of using standard costs is to eliminate the vast amount of clerical detail in industries manufacturing a varied line of staple products or catalogue goods. The system, however, is somewhat dangerous if the work in process account is not watched carefully. The actual expenditures for labor, material and overhead enter into the work in process control, but the credits thereto are made at estimated cost of all articles completed. Unless care is exercised in the use of estimates, the work in process inventory account may require adjustment in a very short time. The personnel of the cost accounting department is very important. When a system of this kind is used it is largely a matter of judgment as to

whether existing shop conditions warrant the changing of the cost estimates. Standard costs should be changed as rapidly as conditions warrant.

Perhaps the best plan for most industries is to use a standard overhead coupled with some method of controlling the production as it takes place in the factory by comparing production standards with actual performance. In addition to this, a **financial budget** should be prepared from estimated costs based on past results and the total summarized actual cost compared with this budget weekly or monthly.

Control of Cost Records

NECESSITY FOR "TIE-IN" WITH GENERAL ACCOUNTING.—Cost accounting is frequently an outgrowth of the desire on the part of the foreman or superintendent of a factory to know something about the comparative costs on different products produced in the shop. At other times it is developed, in a tentative way, to provide the selling department with information for establishing selling prices. When cost accounting has been developed in this way, it is seldom that sufficient attention is given to the **relationship between cost accounts and general accounting.** The expenditures by a company are generally recorded accurately in its general accounts. In cost accounting the same expenditures should be analyzed and redistributed to appropriate cost accounts. If the general accounting and cost accounting transactions are not made inter-dependent, there is no assurance that all items of cost have been taken up in the cost accounts. Cost accounting usually involves a considerable volume of detail and without a definite method of summarizing and controlling the totals, it is impossible to tell if all expenditures have been accounted for.

The practical man who has developed a cost system for the shop's use or for the selling department's use, seldom appreciates the necessity of tying in the cost accounts with the general accounts. On the other hand, when a cost system has been developed entirely by the mechanical type of accountant, the costs are liable to be somewhat impractical for use by the operating organization even though they nicely tie in with the general accounts. In recent years real cost accountants, with the factory and accounting point of view, have entered the field and, as a result, modern cost accounting provides usable practical data for the operating organization, and at the same time ties in accurately and correctly with the general accounting.

In the large modern factory cost accounting is frequently divorced from general accounting both in location and supervision. The tie in between cost accounting and general accounting is maintained by means of a **series of control accounts** in the general books. A control account may be defined as one which shows in total the details found in a subsidiary record. For example, the raw material account in the general ledger may show that $500,000 worth of raw material is on hand. This is a control account for raw material, and is completely analyzed by means of the raw material stock records which show the exact quantity and value of material on hand. Ordinarily, the tie-in between the cost accounting and general accounting is maintained on a **monthly basis.**

The tying in of cost accounting with general accounting does not necessarily mean that the accounting procedures will be complicated. As a matter of fact, if the tying in is done correctly, the cost accounting is simplified, and the management is assured that the costs contain the charges which have actually accrued rather than only the actual expenditures. In some instances the tying in of cost accounting with the general books does increase the volume of costing work to be done, because costs have not been applied to certain departments or

operations for lack of a basis of applying them. This is particularly true where a cost system has been put in by an inexperienced person, not familiar with the various types of cost systems, and who merely stops extending his systems when he finds a department or a series of operations to which his method will not apply.

METHOD OF CONTROL.—The original expenditures for various purposes are accumulated in the **voucher or purchase register** from which they are posted to the controlling accounts in the ledger at the end of each month. This work is done by the general accountant. However, he is dependent upon the cost accountant for information relative to the distribution and use of labor, materials, and various other elements of cost. The cost accountant must, therefore, maintain summaries of direct and indirect labor, the consumption of materials by order number, by product, by department, of the work transferred between the storerooms and operating departments, records of goods finished and shipped, etc.

COST JOURNAL ENTRIES.—The **basic journal entries** with which the cost accountant is concerned are as follows:

1. **Labor.**—In this journal entry the indirect labor for the month is charged to the various departmental burden accounts and the direct labor to the various work in process accounts. The Payroll account is credited. Basis: payroll summaries.

2. **Material.**—In this journal entry raw materials and the like are charged to the various work in process accounts and indirect materials are charged to departmental burden accounts. The proper inventory control accounts are credited. Basis: summary of materials used.

3. **Expense Charges.**—This entry is made for the purpose of charging the various departmental burden accounts with their proper proportion of service charges and various expenditures for materials and the like which do not go through the material accounts. The credit may be to an Expense Ledger Control Clearance account. Basis: voucher register.

4. **Taxes.**—In this journal entry the departments are charged with their proper proportion of prepaid taxes and the Prepaid Taxes Control account is credited. Basis: schedule of taxes.

5. **Insurance.**—The journal entry covers the distribution of liability and fire insurance to the various departments with the credit to the Prepaid Insurance Control account. Basis: schedule of insurance.

6. **Depreciation.**—In this journal entry the departments are charged with their proper proportion of building and equipment depreciation and the Reserve for Depreciation Control account is credited. Basis: schedule of depreciation.

7. **Overhead Absorbed.**—In this journal entry the overhead absorbed is charged to work in process at standard rates. The difference between the overhead absorbed and the actual accumulated overhead represents the overhead which is carried directly to the profit and loss statement. Basis: direct labor by departments at standard overhead rates.

8. **Finished Stock.**—In this journal entry the work in process account is credited with the cost of the goods which have been finished during the month and the Finished Stock account is charged. Basis: summary of orders completed.

9. Cost of Sales.—In this journal entry the goods sold are credited to Finished Stock account and charged to the Cost of Sales Control account. Basis: summary of shipments at cost.

The number and scope of the journal entries will vary considerably in different industries and in different plants. The simple journal entries outlined above merely represent the flow of costs from the beginning to the end of a process.

CLASSIFICATION OF CONTROL ACCOUNTS.—Control accounts are ordinarily divided into **three groups:**

1. Accounts with **permanent balances,** such as raw materials, supplies, finished stock, work in process, machinery and equipment, etc.
2. Accounts with **accumulating balances,** which control the accumulation of actual overhead and expense items.
3. Control **clearing accounts,** which are used for the purpose of accumulating and clearing certain charges which are distributed every month.

ESTABLISHING NECESSARY CONTROL ACCOUNTS.—In establishing control accounts to govern the operation of a cost system, it is important to consider the amount of detail work required in the cost department to accumulate the data necessary for the journal entries so that control may be maintained. For example, the overhead control account may be inclusive, so that transfers can be made between departments without the use of journal entries. In other cases separate control accounts are maintained in the ledger for various departmental overhead. Consequently whenever transfers are made between departments, or when the total cost of service departments is distributed, journal entries must be made for that purpose. In the same manner the work in process department may be inclusive or may be broken down into a series of work in process accounts. In some cases finished stores and finished parts of stores are considered as a part of work in process in order to eliminate the clerical labor involved in the accumulation of journal entries whereby the more detailed accounts may be debited and credited with the monthly transfers.

In all cases a **chart of accounts** should be prepared and published in such a manner that there should be no misunderstanding as to what is to be governed by each control account. This refers particularly to inventory control accounts. Charts are used primarily in order to eliminate errors through charging materials to one account and crediting them to different accounts, because two people may have a different conception as to which account the material belongs. Many materials may be considered as either raw materials or supplies. Consequently, it is necessary for the cost accounting department to specify definitely what materials are to be included in each control account.

In some instances it is found that a good quantity control may be maintained over certain stocks and certain types of departments although the accounting control would be very costly. In such cases it is advisable to use very simple control accounts in the ledger and maintain managerial control on a quantity basis.

Use of Cost Records

RECORDS IMPORTANT TO SHOP ORGANIZATION.—One of the chief duties of the financial department of any organization, particularly of a manufacturing organization, is to make the fullest use possible out of each accounting record. The financial manager should see to it that the shop organization receives copies of operating costs to compare with standards. Departmental foremen should get the monthly overhead statements on which should be listed the original budget figures. The costs obtained from the four basic types of

cost methods previously mentioned should be summarized for shop use so that the factory will benefit from it in future production. Administrative and selling costs should be tabulated as an aid to the managerial and selling ends of the business in keeping within their budget figures. The question of normal overhead rates should be particularly stressed so that the engineering, production, and selling divisions of the business will be continually on the lookout for ways and means of getting in new products on a volume basis which would tend to reduce overhead.

FINANCIAL EXECUTIVE AND THE COST SYSTEM.—The financial executive in formulating his recommendations on financial affairs to the general management must rely on the cost accounting department to furnish him with proper information concerning the **cost of production.** This requires not only a knowledge of basic finance but also a working knowledge of the essentials of cost accounting principles. Where the cost system cannot furnish such data promptly and correctly, the fault may be due to one or more of the following causes:

1. The financial manager's inability to understand and apply cost accounting principles and data as compiled by that department.
2. The cost system does not fit the business.
3. Incompetent cost accounting personnel. The financial executive should be able to detect wherein the personnel fails to obtain proper cost data and to provide the necessary organization to do the work effectively.
4. The inherent difficulty of ascertaining actual costs at a reasonable expense. If the difficulties and expense are out of proportion to results obtained, the cost system used should be abandoned and a simpler type should be selected.

A poor cost system is far worse than none. With none at all the practical manufacturer has a rough idea of actual costs and frequently does not suffer. With an inaccurate system he relies on it or he does not. In the former case he relies on a lie and it will probably ruin him as costs will be understated. In the second case he is a fool for spending money on a cost system which he does not use. A good cost system is the only one to have and in adopting it a business man should look before he leaps. Heretofore there has been much leaping without looking. The real worth of any system may be measured by its practical use in increasing earnings.

SECTION 27

FEDERAL REGULATION OF BUSINESS

This section describes governmental regulations affecting business under the following federal laws:

Sherman Anti-Trust Act of 1890 (26 U. S. Statute 209).
Clayton Act of 1914 (38 U. S. Statute 730).
Federal Trade Commission Act of 1914 (38 U. S. Statute 717).
Capper-Volstead Act of 1922 (57 U. S. Statute 388).
Dumping Act of 1916.
Webb Export Act of 1918 (40 U. S. Statute 516).

The federal laws of the United States governing trade and commerce become operative and effective only in **interstate and foreign trade transactions** and do not apply to local, intrastate business. Companies confining their business to the limits of their own states, and to articles which do not enter into transactions from one state to another, are beyond the scope of the federal laws. In modern business such a situation is unusual and for practical purposes it would be correct to say that the federal laws apply to all concerns except the very small ones.

Sherman Anti-Trust Act

UNREASONABLE RESTRAINT OF TRADE.—The Sherman Anti-Trust Act of 1890, officially designated as "An Act to Protect Trade and Commerce against Unlawful Restraints and Monopolies," forbids all **unreasonable restraint of trade** by declaring illegal:

1. Every contract, combination, or conspiracy between two or more parties which directly restrains interstate trade or commerce.
2. Every act of a person which shall monopolize or tend to monopolize the trade of the several states.

The law applies to **individual acts** as well as to **combined acts** of two or more persons. (*Northern Security Co.* v. *U. S.*, 193 U. S. 197.)

"The standard of reason which had theretofore been applied at the common law and in the United States . . . . against combinations in restraint of interstate or foreign trade or commerce, of monopolization or attempts to monopolize any part of such trade or commerce, was intended to be the measure used for the purpose of determining whether, in a given case, a particular act had, or had not, brought about the wrong against which the statute provided." (*Standard Oil Co.* v. *U. S.*, 221 U. S. 1.)

"A combination of stockholders in two competing interstate railway companies to form a stockholding corporation which should acquire, in exchange for its own capital stock, a controlling interest in the capital stock of each of

such railway companies, violates the Anti-Trust Act of July 2, 1890, which declares illegal every combination or conspiracy in restraint of interstate commerce, and forbids attempts to monopolize such commerce or any part of it." (*Northern Securities Co.* v. *U. S.*, 193 U. S. 197.)

Enlargement and modifications of the Sherman Act by subsequent laws are summarized below. The Sherman Act dealt almost entirely with consummated restraints. This law is in full force and effect. Its purpose, however, is enlarged on the one hand by the Clayton Act of 1914 and limited on the other by the Webb Export Act of 1918 and modified by the Capper-Volstead Act of 1922.

ILLEGAL ACTS AND CONTRACTS.—The law declares illegal every contract, combination or conspiracy which **directly restrains trade.** (*Standard Oil Co.* v. *U. S.*, 221 U. S. 1.) What illegal contracts are may be implied from the course of dealings of the parties or the circumstances surrounding the relations bringing about the contract prohibited by the law. (*Eastern States Retail Lumber Dealers Assn.* v. *U. S.*, 234 U. S. 600.)

MEANING OF UNREASONABLE RESTRAINT.—In order to determine what is reasonable or unreasonable restraint of trade it is necessary **to consider all the factors in the transaction,** such as the nature of the restraint, its extent and effect, the methods by which the power was obtained and the intention of the parties. (*U. S.* v. *Reading Co.*, 40 Sup. Ct. Rep. 425.) The **final test** whether or not an act is an unreasonable restraint is determined by the **intent of the parties and the nature of the act** which, if it has within it the power to suppress competition, is viewed as an act in restraint of trade. (*Board of Trade of Chicago* v. *U. S.*, 246 U. S. 231.)

EXTENT OF RESTRAINT.—To be illegal restraint of interstate commerce must be of an extent defined in the following:

As to Volume of Trade.—In order to give the law jurisdiction it is necessary that the restraint be of a **substantial part of interstate commerce.** (*U. S.* v. *Union Pacific R. R.*, 226 U. S. 61.)

As to Area.—Monopoly of trade in a city by means of a **trade association** whereby wholesalers in articles entering into interstate commerce will not deal with retailers who are not members of the association, may be a violation of the Sherman Act. (*Montague* v. *Lowry*, 193 U. S. 38.)

As to Time.—A restraint for an **unreasonable length of time** will be illegal. The period of restraint need not extend over a protracted time or beyond a period necessary to the bringing in of a new supply in order to be considered illegal. (*U. S.* v. *Corn Products Co.*, 234 Fed. 964.)

Control of Large Part of Trade.—Although the control of a large part of the trade is not conclusive, it may indicate a restraint of trade and will place on the parties the burden of proof to show that the control was lawfully acquired. (*U. S.* v. *Eastman Kodak Co.*, 226 Fed. 62.)

EFFECT OF RESTRAINT.—This may be described as follows:

On the Public.—The reasonableness of a restraint is determined largely by the effect of the restraint. The effect must be **on the public in general** rather than on an individual. (*U. S.* v. *D. L. & W. R. R. Co.*, 238 U. S. 516.)

Corners.—"It well may be that running a corner tends for a time to stimulate competition; but this does not prevent it from being a forbidden restraint, for it also operates to thwart the usual operation of the laws of supply and demand, to withdraw the commodity from the normal current of trade, to enhance the price artificially, to hamper users and consumers in satisfying their

needs, and to produce practically the same evils as does the suppression of competition." (*U. S.* v. *Patton*, 226 U. S. 525.)

Liberty of Action.—Any restrictions tending to suppress competition by limiting the **liberty of action of traders** to engage in business or transact their business in their usual or customary manner is an injury to the trader and to the public and hence is an illegal restraint of trade. (*Laoewe* v. *Lawlor*, 208 U. S. 274.)

Other Illegal Acts.—All acts, contracts, combinations or conspiracies which have for their purpose the suppression of competition are illegal. Such purposes may be accomplished through the coercion of competitors, impairment of quality, oppression of labor, artificial depression, or advancement of prices of raw materials, etc. (*Board of Trade of Chicago* v. *U. S.*, 246 U. S. 231.)

NATURE OF THE RESTRAINT.—In determining whether or not a restraint is reasonable it is necessary to consider the nature of the restraint. The law covers only **direct restraint** of interstate commerce and not indirect or incidental restraint. (*U. S.* v. *Patton*, 226 U. S. 525.) The law applies to the restraint of trade and covers **both the buyer and the seller** as well as their market. In other words, any restraint imposed on buying and selling in interstate trade is illegal. (*Hard Rubber Co.* v. *U. S. Rubber Co.*, 229 Fed. 583; *U. S.* v. *Whiting*, 212 Fed. 466.)

METHODS OF TRADE.—The methods of trade may have a bearing on the **reasonableness of the restraint** imposed on trade. (*U. S.* v. *Reading Co.*, 226 U. S. 324.) Where control was obtained by usual and normal methods of doing business the courts are inclined to view the acquiring of such control as lawful. Size and efficiency resulting in obtaining a large share of business in fair and legitimate ways and in open competition are not penalized by the courts. (*U. S.* v. *U. S. Steel Corp.*, 40 Sup. Ct. Rep. 293.)

PENALTY FOR VIOLATION.—Every person violating the statute shall be deemed guilty of a misdemeanor, and on conviction is liable to be punished by a fine not exceeding $5,000 or imprisonment not exceeding one year or both at the discretion of the court. (July 2, 1890, C. 647, Section 1-26, U. S. Statute 209.)

Clayton Act

SCOPE OF ACT.—The Clayton Act of 1914 **enlarges on the Sherman Anti-Trust Law** in that it defines and prohibits specific acts and methods. The Act declares unlawful such acts as may substantially lessen competition or tend to create a monopoly. It supplements the Sherman Law by regulating trade practices not covered by that law. Such practices include price discrimination, exclusive contracts, holding companies and interlocking directorates. The Act prohibits **price discrimination between purchasers in domestic trade** where its effect may tend to create a monopoly or substantially lessen competition in any line of commerce except where the difference in price is due to a difference in grade, quality, quantity, cost of selling, cost of transportation, or is made in good faith to meet competition. Different prices to wholesalers and retailers or other classes of customers are permitted if not made for the purpose of restraining trade. (*Bawn* v. *Goodyear Tire & Rubber Co.*, 256 Fed. 570.)

EXCLUSIVE CONTRACTS.—Section 3 of the Clayton Act declares contracts with purchasers relating to the sale, lease, or use of commodities and the fixing of prices in such a manner that purchasers shall not deal with com-

petitors, where the effect of such arrangements is to lessen competition or create a monopoly to be unlawful. This section of the law was designed to reach those large concerns which have an established demand for their goods or have patented articles which are sold on such terms as to exclude their competitors. (*United Shoe Machinery Co.* v. *U. S.*, 42 Sup. Ct. 363; *Standard Fashion Co.* v. *Magrane-Houston Co.*, 42 Sup. Ct. 360.)

LABOR IS NOT AN ARTICLE OF COMMERCE.—Section 6 declares that labor of a human being is not a commodity or an article of commerce. Under this section of the law the various trade laws and anti-trust laws of the United States do not apply to labor organizations.

INTERCORPORATE STOCKHOLDINGS.—The Act (Section 7) prohibits corporations engaged in interstate trade from acquiring stock in competing corporations where the effect of such acquisition may be to lessen substantially competition between them. The law **does not apply** where stock is obtained for the following reasons:

Investment—where such stock is purchased solely for investment and is not obtained for purpose of lessening competition.

No competition—where the nature of business of the two corporations is such that there is no natural competition between them.

Subsidiaries—where the stock is in subsidiaries which carry on natural parts or branches of the company's business provided that the effect is not to substantially lessen competition.

Export companies—where the corporation owns stock in a company engaged solely in the export trade, unless the purpose is to lessen competition in the United States. (Section 7 Clayton Act as modified by Section 3 of the Webb Export Act.)

INTERLOCKING DIRECTORATES.—Article VIII of the Clayton Act prohibits one person from serving as a director in two or more companies engaged in interstate commerce and trade if any one has a capital, surplus and undivided profits aggregating $1,000,000, and if such corporations have been or are naturally competitors of one another. The purpose of this section was to overcome some of the tendencies toward corporate abuses and the elimination of competition brought about by unity of management. An interpretation of the Anti-Trust Law is necessary to determine the lawfulness of interlocking directorates. Several companies may have intercompany directors regardless of their capital, unless those corporations by reason of the nature of their business and their relations to one another are such that they could eliminate competition by having interlocking directorates.

NATIONAL BANK DIRECTORATES.—Section 8 sets forth the circumstances under which **interlocking directorates** of national banks are forbidden. Some of the conditions, subject to certain exceptions, are:

1. No person shall at the same time be an officer, director or employee of more than one national bank where the aggregate deposits, capital, surplus and undivided profits exceed $5,000,000.

2. No person who is a director of a state bank or trust company having deposits, capital, surplus and undivided profits aggregating $5,000,000 or more will be eligible as a director of a national bank.

3. In cities of over 200,000 a national bank shall not have as an officer, director, or employee any private banker or any director, officer or employee of any other bank or trust company located in the same place.

ENFORCEMENT OF LAW.—Under Section 2 of the Clayton Act the following federal bodies are vested with authority to enforce Sections 2, 3, 7 and 8 of that law:

Federal Trade Commission where applicable to trade and industry.
Interstate Commerce Commission where applicable to common carriers.
Federal Reserve Board where applicable to national banks.

The law **does not apply** to **mutual savings banks.** Moreover, a director in a national bank, although he may be precluded by the law from becoming a director in another national bank, may nevertheless become a director of one other bank, state or national, where the entire capital stock of one of the banks is owned by the stockholders of the other. Also, a **director of Class A of a Federal Reserve Bank** may be an officer, director, or both, in one member bank.

The Federal Trade Commission

PURPOSE AND MEMBERSHIP.—The Federal Trade Commission was created by Congress in 1914 for the purpose of co-ordinating in a measure governmental relations with business. Broadly speaking, the object of the Commission is to accumulate experience, maintain continuity and consistency of governmental policy toward business, and to aid in bringing about constructive legislation regulating interstate trade and commerce. Its **primary function** is to initiate at its own discretion investigations and to furnish information to Congress regarding additional legislation for regulating interstate and foreign trade.

The Commission consists of **five commissioners** appointed by the President with the advice and consent of the Senate. Appointments are for terms of 7 years with a salary of $10,000 a year. The commissioners are not allowed to engage in any other business, vocation or employment, and not more than three of them may belong to the same political party. The commissioners may be removed from office by the President for cause which may consist of inefficiency, neglect of duty, or malfeasance in office.

SCOPE OF POWERS.—The Commission's powers are:

1. Investigative
2. Advisory, and
3. Regulative

These powers are derived primarily from the Federal Trade Commission Law and the Clayton Act and are confined to interstate and foreign trade.

POWERS TO INVESTIGATE.—The investigative powers of the Commission may be summarized as follows: To investigate anywhere within the United States the conduct, practice, organization, management or business of any corporation engaged in interstate trade and its relation to any other business conducted by a corporation, partnership, sole owner or association. The **only exceptions** are banks, railroads and other common carriers.

Although the Commission has broad powers to investigate there are **certain limitations,** among which are:

1. The **law itself,** whereby the Commission is limited to the purpose for which it was created.
2. The **Federal Constitution,** which provides in the Fourth Amendment that persons should not be subjected to unreasonable searches and seizures, and in the Fifth Amendment, that no person shall be compelled to incriminate himself.

3. The **purposes of the Commission,** the functions of which confine it to businesses engaged in interstate trade.
4. **Other functions,** which limit the investigative power to the scope of its correlative advisory and regulative powers.
5. As the Commission itself is subject to the law, any person called upon to give information may refuse to do so if he can show that the information sought does not relate to the subject under investigation or which the Commission has a right to investigate under the Clayton Act or Federal Trade Commission Act.

The Commission has shown a tendency to increase the scope of its authority eyond reasonable limits, and in many important cases the United States ourts have refused to uphold the Commission, among which are the following: ederal Trade Com. v. *American Tobacco Co.* and *P. Lorillard Co.*, 264 U. S. 98 (1924); *Federal Trade Com.* v. *National Biscuit Co.*, 266 U. S. 613 (1925); ederal Trade Com. v. *Hammond Snyder & Co., Baltimore Grain Co.*, and *I. C. Jones Co.*, U. S. Supreme Court, March 15, 1925.

METHODS OF INVESTIGATIONS.—The Commission may conduct its vestigations by:

1. Obtaining information from other departments and bureaus of the government.
2. Requiring reports from corporations.
3. Examining and copying documentary evidence of corporations.
4. Summoning, under subpoena if necessary, and examining witnesses and documents.
5. Enforcing its investigative authority by requesting proper governmental authorities to bring actions which may consist of one of the following:
   (a) Contempt proceedings
   (b) Actions for penalties
   (c) Criminal prosecutions
   (d) Proceedings in mandamus

REPORTS FROM CORPORATIONS.—The Commission may ask corpotions for reports on particular matters, if they relate to trade, with a view determining whether there are alleged violations of the anti-trust laws. ich reports must be restricted not only to obtaining facts relating to matters fore the board but must also be confined to corporate organization, business actice and management, and its relations to other corporations, persons or rtnerships. Under Section 6 (b) of Federal Trade Commission Act, the filing reports is required of corporations but does not apply to individuals, banks d common carriers. The Commission may classify corporations and require ports from certain classes and not of others; also it may require **annual ports and special reports.** The form of reports, whether under oath or otherse, when to be filed, questions to be propounded to the corporations, and ch rules as it may see fit to carry out the provisions of the Federal Trade ommission Act and the Clayton Act, are under the control of the Commission.

TYPE OF REPORT REQUIRED FROM CORPORATIONS.—The follow- g is the type of report the Commission requires of corporations:

REPORT ON INDUSTRIES

This report is requested for the purpose of compiling data for the industry in which ur company is engaged, and a summary of the industry will be sent to you as soon as

prepared by the Commission. No information will be disclosed or published regarding the business of any particular concern.

Information furnished is for the year ending....., 19—

(Answers should cover calendar year 1915 or your fiscal year corresponding most nearly thereto.)

1. Name of concern.....
   Main office.....
   (Street) (City and State)
2. Kind of business in which engaged.....
   If manufacturing or producing, state principal product or class of products manufactured or produced.....
   If mercantile, state principal commodity or class of commodities dealt in and whether retail or wholesale.....
3. Capital stock outstanding at close of year:
   Common stock..... $.....
   Preferred stock..... .....
4. Bonds and similar obligations outstanding at close of year..... .....
5. Accumulated surplus (including undivided profit), or accumulated deficit at close of year (if deficit, so indicate)..... .....
6. Net sales for year (gross sales less trade discounts and outgoing freight on sales)..... .....
7. Net profit (or loss) from operations during the year after deducting all expenses except interest on bonds and on similar obligations .....
8. Net income from other sources during the year..... .....
9. Depreciation on plant and equipment charged off during the year .....
   Average rate, 1915.....%; 1914,.....%; 1913,.....%.
10. Bad debts charged off or provided for during the year..... .....
    Percentage of bad debts, or provision therefor, of credit sales, 1915,.....; 1914,.....; 1913,.....
11. Have items 9 and 10 been deducted in arriving at item 7? .....

Signature,.....
(Title of official signing).....
Date....., 19—

EXAMINING DOCUMENTS AND WITNESSES.—Under the law the Commission may examine any **documentary evidence of any corporation under investigation.** The law defines documentary evidence as meaning all documents, papers and correspondence in existence at or after the passage of the law. (Section 4.) The powers of the Commission **to examine witnesses** may be summarized as follows:

1. Corporations and individuals are subject to examination.
2. There must be a matter under investigation, or proceeding pending over which the Commission has legal jurisdiction.
3. The Commission is bound by the essential rules of legal evidence so as not to prejudice the rights of individuals and corporations against whom proceedings are taken.
4. The Commission has greater freedom of action in pursuing its advisory function to obtain information to enable it to make reports and recommendations for legislative purposes than it has in pursuing its legal regulative functions.
5. Subpoena may be issued by any member of the Commission to require attendance of witnesses from any part of the United States.
6. Testimony may be taken by deposition in any proceeding before the Commission.

INVESTIGATION OF INDIVIDUALS.—The powers of the Commission in so far as they relate to investigations of private persons, are confined to the

nstitutional limitations and to such matters as are made the subject of a com- int or a judicial investigation before the Commission under the Federal Trade ommission Act against unfair methods and under the various sections of the layton Act. A natural person need not furnish any information in any kind f a proceeding if such information will tend to incriminate him. Corporations ave not this protection, nor have private persons in matters relating to in- rmation which would incriminate a corporation (Section 9). The funda- ientals of legal procedure apply in the exercise of the Commission's powers. ny natural person who may testify or produce evidence before the Com- ission on any account, transaction, or matter, shall not be prosecuted or ubject to any penalty on the subject matter testified to. In order to obtain mmunity under this section the Federal Trade Commission Act specifically ets forth as a prerequisite that such testimony or evidence so furnished shall e pursuant to the issuance of a subpoena (Section 9).

MEANS OF ENFORCING POWERS.—To secure the enforcement of its owers to investigate, the Federal Trade Commission has the same powers as he Interstate Commerce Commission, which may be summarized as follows:

1. Criminal proceedings
2. Action for penalties
3. Contempt proceedings
4. Mandamus

OFFENSES AGAINST THE UNITED STATES.—Acts done with the intent o obstruct or resist the Federal Trade Commission are offenses against the Jnited States. These are summarized as follows:

1. Refusing to furnish the Commission, for the purpose of inspection and making copies, any documentary evidence of any corporation subject to the jurisdiction of the Commission.
2. Refusal or willful neglect to produce documentary evidence; refusal to attend, testify or answer any lawful inquiry or requirement of the Commission in obedience to a subpoena.
3. Altering, mutilating, destroying or removing from the United States any documentary evidence of any corporation subject to the Federal Trade Commission Act.
4. Making a false report on any statement required by the Commission.
5. Making false entries on the records and accounts of a corporation subject to the Federal Trade Commission Act.
6. Willful neglect or causing not to be made complete, accurate and full records of all facts and transactions pertaining to the business of a corporation subject to the Federal Trade Commission Act.

PENALTIES.—Persons convicted by a federal court of competent jurisdiction or one of the foregoing offenses against the United States may be fined not less han $1,000, nor more than $5,000, or imprisonment or both. For refusal to ppear, testify or produce documents, the maximum imprisonment is 1 year, nd for the other offenses, 3 years (Section 10).

ADVISORY POWERS.—The advisory powers of the Commission may be ummarized as follows:

To Congress.—To furnish information and advise on any domestic or foreign rade conditions which may affect trade or commerce of the United States. o report alleged violations of the anti-trust laws by corporations (Section 6).

To the Courts.—On request of the courts to ascertain and advise on the ppropriate form of decree in suits in equity brought by the Attorney General

under the anti-trust laws in order to enforce the laws with the least inconvenience to business (Section 6). The dissolution of a combination or consolidation violating the anti-trust laws is a complex problem and the formulating of a proper decree to bring this about taxes the ingenuity of the courts. In the past criticism was made that the decrees have not entirely accomplished their purpose. (See *Standard Oil Co.* v. *U. S.*, 221 U. S. 1; *American Tobacco Co.* v. *U. S.*, 191 Fed. 371.)

To U. S. Attorney General.—Make recommendations to bring about a readjustment of the business of corporations violating the anti-trust laws so that thereafter the corporations may conduct their affairs in accordance with the law (Section 6). Report on the manner in which corporations are carrying out the final decrees against such corporations for violating the anti-trust laws.

To the Public.—Furnish information, reports and advice regarding many trade matters, except trade secrets and names of parties reporting to them. The Commission is authorized to publish from time to time such information regarding trade which it considers of public interest (Section 6).

REGULATIVE POWERS.—The Commission has regulative power to take statutory proceedings to obtain a decree of a court of competent jurisdiction to accomplish its purpose under the Federal Trade Commission Act and the Clayton Act, the principal sources of the Commission's powers. Under the Clayton Act the following are declared unlawful:

Price discrimination between purchasers where such discrimination tends to substantially and unreasonably decrease competition or to create monopoly in any line of trade (Section 2).

Exclusive purchase and sales arrangements, where such arrangements may substantially decrease competition or tend to create monopoly and which are obtained by fixed prices for resale on such terms that the purchaser or seller shall not deal with competitors.

Intercompany stockholdings and holding companies where by reason of such holdings the competition of the companies will be substantially decreased in a community so as to tend toward a monopoly.

INTERLOCKING DIRECTORATES.—A director of a **national bank, state bank or trust company** with capital, surplus and undivided profits of over $5,000,000, cannot, with certain exceptions, be a director of another national bank. A person cannot be a director at the same time in two or more companies engaged in interstate trade and commerce any one of which companies has capital, surplus and undivided profits of more than $1,000,000 where such companies are competitors and the elimination of such competition would result in a violation of the anti-trust laws. **Unfair methods** in trade and commerce are declared unlawful under the Federal Trade Commission Act and under the Clayton Act. The Commission has **no power to punish violations** of the law. Its authority is essentially preventive in so far as its orders may be sanctioned and enforced by the courts.

PROCEDURE OF THE COMMISSION.—The Commission is a **complaining witness** and begins proceedings by issuing and serving a complaint and notice setting forth the charges of the Commission and setting a time and place where the hearing is to be held. This notice must be served on the proper person who, in a corporation, may be the president, secretary, or other officer. Notice must be given at least 30 days before the time the hearing is to be held.

Heretofore the complaints of the Commission were published before the issues were tried, which in many cases did great harm to business. In May

1925, the Commission was reorganized and the new majority made an effort to end the many injustices done to honest business by publishing tentative reports and complaints before all the facts were known and the issues tried. The Commission decided to withhold publication of complaints. In short, it would follow the rule of the common law that regards a defendant as honest and guiltless until the contrary is proved. The members of the Commission are not in agreement as to the legality of this rule and have sought advice of the Attorney General on this subject together with other phases of the Commission's powers.

The Commission has **no compulsory process** to enforce attendance at its hearings by warrant, attachment, etc. An accused person may or may not attend. Refusal to attend, however, would be prejudicial if a defendant would want to make a defense before the Commission at a future time. His refusal to attend the hearings automatically precludes him from attending the future hearings and present his defense. The Commission itself has no authority or process to enforce its own orders. For this purpose the **aid of the U. S. Circuit Court of Appeals** is required. The courts, however, are not bound by the recommendations of the Commission, and when they do act they have **original and not appellate jurisdiction.**

TRADE PRACTICE SUBMITTAL.—The trade practice submittal is a procedure which was instituted by the Federal Trade Commission as a means for assisting the proceedings provided by statute for the elimination of unfair methods of competition. It had its origin in an effort to eliminate, simultaneously and by consent of those engaged in a given industry, practices which, in the opinion of the trade, are unfair. This procedure has been employed by the Commission on its own initiative when a large number of complaints come to the Commission from a single industry, and has been employed at the request of the industries involved. The practices agreed upon by the industry as unfair are thereafter held by the Commission to be prima facie unfair when considering complaints against concerns in the industry if the particular practices are within the jurisdiction of the Commission.

A **typical trade practice submittal** of the subscription book publishers is given below.

TRADE PRACTICE SUBMITTAL OF SUBSCRIPTION BOOK PUBLISHERS

At the request of the Subscription Book Publishers Association a trade practice submittal was held with the book publishers selling books by subscription, in Washington, D. C., on May 20th and May 21st, 1924. Commissioner John F. Nugent presided at the conference.

It was found that many of the publishers who sell books by subscription are not members of the Association. The Association has twenty-eight members, although the number of concerns engaged in this line of business outside of the Association is probably twice that number. An attempt was therefore made to ascertain the views of those outside the Association with respect to the question as to whether a trade practice submittal was desired. Those publishers were notified of the practices which the Association desired to discuss at the meeting and were also advised that the discussion would not be limited to those practices and that other practices which publishers, not members of the Association, might desire to present would be considered. Many replies were received expressing an interest in such a meeting, so that the date was set. Invitations were sent to all members of the industry whose names were furnished to the Commission. . . .

Thirty-one concerns were represented at the meeting and it was there stated that they do more than the majority of the volume of said business of the country. Many other concerns expressed an interest in the meeting but were unable to be represented.

After a preliminary discussion of various practices, the representatives of the concerns mentioned were requested to and did organize for the purpose of adopting resolutions by

which the opinion of the trade might be registered and the following resolutions, which have been certified by the Chairman and Secretary of the meeting, were adopted.

1. Resolved, That we disapprove any editorial policy whereby the listing of any name as editor or contributing editor tends to practice deception on the public.

2. Resolved, That as to all books, the use of only the last date of copyright, and eliminating all previous copyright dates, is condemned.

3. Resolved, That books bound in substitutes for leather should not be represented as being bound in levant or in any way which tends to carry the inference that leather bindings are used.

4. Resolved, That the same or essentially the same set of books should not be sold simultaneously under different titles; that books should never be sold under a title that will mislead as to contents, or under a title which tends to confusion with some previously published work.

5. Resolved, That the marking-up of the price of books and the use of the so-called "raised" contract be condemned; that representing that the price asked is below the usual price, or that the price will soon be increased, when such is not the fact, be also condemned.

6. Resolved, That when so-called extension, revision or continuation service is offered, the contract made with the purchaser shall state precisely what the service is, that such service is sold at a price distinct and apart from the books which it is designed to keep up to date, that the books shall be sold at a stipulated price, and the service shall be sold at a stipulated price; that in case such service is sold to continue over a period of years the service shall actually be furnished as promised to such subscriber without the use of coupons or other form of request.

7. Resolved, That the practice of representing that a certain number of books have been set aside for advertising purposes, to be given free, when such is not the fact, is condemned; and that the practice of representing that a certain number of selected persons in each community have been designated to secure a book or a set of books, or any form of service, free, when such is not the fact, is clearly misrepresentation, and is condemned.

8. Resolved, That the offering of membership in societies, clubs and other organizations, which in fact do not exist, in connection with the sale of books be condemned; that a service devoted to the answering of inquiries, if offered, be represented only as such and not as something offered by some organization, separate and apart from the concern selling the books when such organization does not exist, in fact, and actually renders no such service, and the names of well-known authors, editors or authorities should not be used in connection with such offers unless they, in fact, actually are to answer or supervise the answering of the inquiries.

9. Resolved, That the practice of securing agents by misleading or dishonest promises or guarantees, and enticing away the agents of competitors by such means be condemned, but nothing in this resolution shall be construed in any way limiting the free choice of agents to select their own employers.

10 Resolved, That the practice of giving with services or sets, premiums of books, service or other objects of value, shall not be abused by sales representations of which the effect is to deceive the purchasers as to the relative values of the set or service as compared with the premium accompanying it.

11. Resolved, That no publisher shall be a party to or assist in the organization of so-called independent agents or dealers to sell his books by methods here condemned, and which he as a publisher professes himself not to use; nor shall a publisher sell his books to so-called independent agents or dealers or agents when he knows they are to use unfair or dishonest means to distribute the books to the public. No publisher shall be a party to doing indirectly what he professes not to do directly.

12. Resolved, That it shall be an unfair practice to take a name which so closely resembles the name of an already existing firm as to tend to cause confusion and mislead the public.

13. Resolved, That all testimonials should be genuine and apply to the book or books actually offered; that generally the complete testimonial should be given; and that in cases where only a part is used, such part should fairly state the name of the writer, and in no case shall words, phrases or sentences be taken from a testimonial and be used for selling purposes which when taken from their context have a different meaning from that intended by the writer; that public bodies, libraries, or associations should not be advertised or

represented as commending a set of books unless advised as to the use of such commendation, and unless the fact is that the public body, library or association as such and not merely some individual has commended the work and that no testimonial from any source whatsoever which has been obtained by purchase, gift or honorarium be used; securing testimonials by such means, whether by more or less open or by subtle methods is condemned.

14. Resolved, That these resolutions, in so far as practicable, become effective at once; except, that where any changes in an existing edition of a book, or set of books may be required, these resolutions apply to all future editions or printings.

With the exception of resolution No. 10, the resolutions as stated above were adopted by the members of the industry present, unanimously. Attention is also directed to the fact that it is the intention of the industry to put these resolutions into effect immediately.

The above resolutions were reported to the Commission and after consideration were received and approved. (Official statement released for publication July 31, 1924.)

Trade Methods Declared Unfair and Unlawful

TWO GENERAL TYPES.—The Federal Trade Commission Act declares unlawful the use of **unfair methods of competition** in interstate and foreign trade and commerce. Although the Act does not attempt to define what unfair competition and methods are, it empowers the Federal Trade Commission to determine what unfair methods are, **subject to review by the courts** as to the fairness or unfairness of their findings in specific instances. Under the various findings and decisions of the Commission and of the courts, unfair methods resolve themselves into **two types:**

Those which **offend good morals** because of the nature of the act, such as fraud, deception, bad faith, etc.

Those acts which, although not wrong in themselves, have a tendency to **limit competition,** tend toward monopoly, or are **against public policy.**

The following is a classification of some of the unfair methods **passed on by the courts:**

1. Injury to the public
2. Local price cutting
3. Paying rebates
4. Espionage
5. Full line forcing
6. Boycotts and blacklists
7. Fighting brands
8. Unfair methods in competition

Injury to the Public.—Practices in trade which result in an injury to the public as distinguished from private injury are declared unlawful if they tend to destroy individual opportunity or artificially increase prices. Judge Sanborn in *U. S.* v. *International Harvester Co.*, 214 Fed. 987, says in part:

"It is equally well established that the reason for the prohibition by . . . ., the statute under consideration the unreasonable restraints of and attempts to monopolize trade was and is that, by unduly restricting competition they (acts) are injurious to the public in that (1) they raise the prices to the consumer of the articles they affect, (2) limit their production, (3) deteriorate their quality and (4) decrease the wages of the labor and the prices of material to produce them" . . . .

"Undue injury in the ways just stated to the public (that is to say, to the consumers and makers of the articles produced or sold) is the basis and reason for the prohibition and the test of undue or unreasonable restraint or attempt to monopolize."

Generally speaking, practices which tend to injure or prejudice the public in a material way through fraud, deception or dishonest methods, are unlawful. (*Fed. Trade Com.* v. *Winstead Hosiery Co.*, 42 Sup. Ct. 384.)

Local Price Cutting.—This practice consists of cutting prices **by a monopolistic firm** in a certain section where there is competition to a point below the cost of production, if necessary, with the view of destroying competitors, and by raising prices in those sections where there is no competition. After the local competitors are driven out of business, prices are raised to a profitable basis. (*U. S.* v. *Great Lake Towing Co.*, 208 Fed. 733.)

Paying Rebates.—Article III of the Clayton Act declares unlawful the giving of **rebates on the price of goods** which are sold on such restrictions and conditions that the purchaser shall not buy goods from competitors of the seller. Various arrangements are made to bring about this condition, but the one generally followed is the making of an agreement with the purchaser for the exclusive sale of the goods of the seller, and after a certain period, giving a refund based on his purchases, provided that the purchaser during the subsequent period still continue as a purchaser under such an agreement. The effect is to confine the dealer to the products of the seller and restrict competition for a continuous period. (*U. S.* v. *Eastman Kodak Co.*, 226 Fed. 62.)

Espionage.—The obtaining, in a legitimate manner, of information regarding the business and methods of competitors is unquestioned. Where, however, questionable methods are employed, such as the use of detectives, spies, bribing of employees, etc., it becomes an unfair method declared illegal under the trade laws. Such methods have been employed for various purposes, among which are local price cutting and observing their effect on local competitors, finding out if exclusive sales arrangements are observed, etc. (*U. S.* v. *Eastman Kodak Co.*, 226 Fed. 62; *Fed. Trade Com.* v. *Am. Agr. Chem. Co.*, 1 F. T. C. 226.)

Full Line Forcing.—Forcing a dealer to handle the full line of goods of a **company with monopolistic tendencies** is unlawful. To accomplish this purpose various methods are employed. Generally, some desirable or patented article in great demand is used as a means to this end. The seller refuses to sell such articles unless the buyer purchases the entire line, which may contain some articles which are undesirable and can be obtained from competitors on better terms. (*U. S.* v. *United Shoe Machinery Co.*, 227 Fed. 507.)

Boycotts and Blacklists.—The use of boycotts and blacklists in conjunction with other methods resulting in restraining trade or eliminating competition is illegal. When used in conjunction with exclusive purchase and sales agreements, they render it impossible for a person who violated the agreement as to price fixing, purchase, sale or other terms of the agreement to obtain any further merchandise from the firm seeking the monopoly. On the other hand, boycotts and blacklists were used by associations of retailers **against manufacturers** who sold direct to consumers. Such acts were held illegal, being in violation of the Sherman Anti-Trust Act. The companies were permanently enjoined from issuing such blacklists and conducting boycotts. (*U. S.* v. *Eastern States Retail Lumber Dealers Assn.*, 234 U. S. 600; *Fed. Trade Com.* v. *Western Sugar Ref.*, 2 F. T. C. 151; *Straus* v. *Am. Publishers Assn.*, 231 U. S. 222.)

Fighting Brands.—The adoption of fighting brands to drive competitors out of business is considered unfair trade. The method followed, with certain variations, is for a concern which desires to destroy competition to adopt a particular brand, ostensibly made by an independent dealer and sold to the customers of the competitors through different channels, salesmen, etc., at low prices, generally below the cost of production. When the customers have

en won away from the competitors and the monopolistic company feels at it is well intrenched, the fighting brand is discontinued.

Unfair Methods of Competition.—What unfair methods are in trade and ompetition is not defined specifically by the laws and it is necessary to go to e many court decisions for definitions. Generally speaking, the term as ed by the United States Supreme Court means trade practices which tend suppress competition, restrain trade unduly, or create a monopoly. Chief stice White in *Standard Oil Co.* v. *U. S.*, 221 U. S. 42, said:

"Without attempting to follow the elaborate averments on these subjects, read over fifty-seven pages of the printed record, it suffices to say that such verments may properly be grouped under the following heads: Rebates, references and other discriminatory practices in favor of the combination by ilroad companies; restraint and monopolization by control of pipe lines, nd unfair practices against competing lines; contracts with competitors in straint of trade; unfair methods of competition, such as local price cutting the points where necessary to suppress competition; espionage of the siness of competitors; the operation of bogus independent companies and ayment of rebates on oil with the like intent."

Several Typical Unfair Methods of Trade

Some of the business methods declared unfair or illegal by the Federal Trade ommission and the federal courts are set forth below.

COMMERCIAL BRIBERY.—The following are some of the forms of commercial bribery:

Bribing Customers' Employees.—Where corporations or individuals give nd offer to give employees of their customers or prospective customers, without the knowledge and consent of their employers, sums of money as an inducement for them to influence their employers to purchase from them, the donors, nd to refrain from dealing with competitors, this constitutes unfair methods competition and is illegal. (*F. T. C.* v. *Seymour Chem. Co. et al.*, 4 F. T. C. 69.)

Payment of, and offers to pay, employees of customers without their knowledge or consent, a **commission or bonus** of a given per cent of the bill for epairs done for the customer, thereby tending to induce employees to prefer he giver unduly over competitors, and to induce competitors to maintain milar practices, thereby tending to increase the cost of repairs unduly and nfairly, were held as constituting unfair methods of competition. (*F. T. C. Wm. Robinson*, 4 F. T. C. 97.)

Lavish Entertainments.—Lavish entertaining by means of automobile arties, theatre parties, etc., together with paying of **secret commissions** mounting to 5% of the invoice, all aggregating thousands of dollars annually, onstitute unfair competition, the effect of which were to increase the price of he product to customers, taking unfair advantage of owners or employers ho received no consideration in return for such expenditures. (*F. T. C.* v. *G. McFarlane*, 4 F. T. C. 292.)

RESTRICTION OF COMPETITION.—Competition is restricted by the llowing practices:

Division of Territory.—An agreement whereby each member to the agreement is given exclusive use of a certain territory, thereby giving a monopoly that territory, is illegal. (*U. S.* v. *Cowell*, 243 Fed. 730; *F. T. C.* v. *Texas* ., 273 Fed. 478.)

Classification of Trade.—Although an individual may select a party with whom he will deal, the united action by members of a trade association to accomplish this is unlawful. (*U. S.* v. *Colgate & Co.*, 250 U. S. 300.)

Allotment of Customers.—The practice sometimes adopted by sellers by which a particular customer is assigned to one seller, his competitors agreeing not to do business with such customer or to quote him only prices higher than to others, is unlawful. (*U. S. Tobacco Co.* v. *American Tobacco Co.*, 163 Fed. 701.)

Curtailment of Production or Supply.—Agreements suppressing competition of production, with an increase of price as an inevitable result, is illegal. This may be done by—

1. Common selling agency.
2. Agreement between employers and workers.
3. Fomenting and financing strikes.

Restricted Distribution.—Attempts to control channels of distribution are considered unfair. (*California Wholesale Grocery Co.* v. *F. T. C.*, 275 Fed. 725.)

Operating a Secret Subsidiary Company.—Where a corporation purchased the capital stock of a competing company, caused its own employees, or officers of the competitor to convey to it the business, and proceeded to serve substantially all the trade theretofore served by the competitor, with the result that existing competition between the two concerns and prospective competition was suppressed and destroyed, and that commerce in the territory covered by the competitor was restrained and with a tendency to create a monopoly in said corporation, it was held that such acquisition of stock, conveyance of business and property and subsequent dealings, were a violation of Section 7 of Clayton Act. (*F. T. C.* v. *Armour & Co.*, 4 F. T. C. 457.)

Limitation of Use and Resale of Patented Articles.—Obtaining a patent results in restraining others from manufacturing, selling or using the article patented without the consent of the holder of the patent right. The legal monopoly covers only the patented article, and when sold, the patent holder cannot impose restrictions regarding its use, prices at which it is to be resold, or the use of certain specified materials on the patented article. (*Straus* v. *Victor Talking Machine Co.*, 243 U. S. 490; *Motion Picture Patents Co.* v. *Universal Film Mfg. Co.*, 243 U. S. 502.)

MISREPRESENTATIONS.—The following misrepresentations have been declared to constitute unfair methods of trade:

Simulation of Corporate and Trade Names.—Such practice with intent to mislead and confuse the trade and the public constitute unfair methods of competition. (*F. T. C.* v. *United Allegretti Co.*, 4 F. T. C. 120.)

Simulation of Trade Marks, etc.—This together with the wrongful appropriation of competitor's matter, mislabeling and false and misleading advertising, constitutes unfair methods of competition. (*F. T. C.* v. *M. G. Slocum et al*, 4 F. T. C. 155.)

Mislabeling and Misrepresentation of Prices.—Labeling of containers bearing the legend "Price $1.50" or "Price $3.00," the price shown being fictitious and exaggerated with the effect of misleading purchasers and the general public into believing that the said prices are its usual retail prices, and of enabling, encouraging and aiding dealers to defraud the public by obtaining excessive prices, or by selling at less than the figure indicated, to mislead and deceive purchasers into believing that the high grade of goods was being sold

a reduced price has been held to be unfair. (*F. T. C.* v. *Marx Finstone*, F. T. C. 163.)

Misbranding of Inferior Goods.—Such misbranding by well known standards, branding inferior steel as "Sheffield," with a tendency thereby to mislead e retailer into believing that the same was made in Sheffield and to encourage isrepresentation to that effect, and with the effect of similarly misleading a ibstantial part of the purchasing public and of competing unfairly both with akers of or dealers in the genuine Sheffield cutlery and with domestic cutlery ot so branded, to the injury of both and to the injury of free competition, in e sale of cutlery, has been held to constitute unfair methods of doing business.

Misbranding of Substitutes.—Advertising as "White Ivory" articles com-osed of nitrated cellulose and resembling ivory in color, with a tendency to islead and deceive the purchasing public as to the value and to induce the rchaser in mistaken belief that they were made of ivory—such false and isleading advertising has been held to be an unfair method of competition *T. C.* v. *A. Lisner et al.*, 4 F. T. C. 305.)

Misbranding of Imitations.—Pens marked "14 K. Gold Plated," the arrange-ent being such that the barrel of the pen obscured "plated," leaving visible e words "14 K. Gold," with the effect of misleading the purchasing public to believing that the pen points were 14 karat gold, and of encourag-g and aiding thereby the misleading and deceiving of the public, have been eld to be unfair methods.

Misbranding of Adulterated Products.—Sale of adulterated product as re is unlawful. (*F. T. C.* v. *Polomo Specialty Co.*, 2 F. T. C. 195.)

Selling Repaired and Rebuilt Articles as New.—This has been held as unfair ethods of competition. (*F. T. C.* v. *The Check Writer Mfr. Inc. et al.*, 4 T. C. 87.)

SUMMARY OF UNFAIR TRADE PRACTICES.—The Federal Trade ommission has declared as unfair and illegal many trade practices which ve been classified according to the mediums of development of those practices the purposes sought to be accomplished thereby. The following is a mmary:

dvertising:

Agency's information obtained under false pretenses.
Discrimination in sale of space.
Free advertising conditioned on non-sale of competitor's product.
Inducing refusal of competitor's advertisements.
Publishing journal for advertising purposes and including advertisements of reputable firms without permission.
Rebates to customers for advertising manufacturer's product.
Simulation of competitor's advertising.
Simulations of news items.

oycotting:

Various phases of boycotting by individuals, associations, purchasers and sellers.

each of Contract, Inducing of:

Arrangements having for their purpose the breaking of contracts by employees are considered unfair. (*F. T. C.* v. *Stanley Booking Corporation*, 1 F. T. C. 212.)

ibery (Commercial):

Of associations and conventions.

Of customers' and prospective customers' employees to further the sale of various products.
Of customers' salesmen.
Of public officials.

Competitors, Practices Directly Against:
Accepting shipments intended for competitors.
Affiliation with competitors falsely claimed.
Catalogues, destruction of.
Containers of competitors illegitimately used.
Competitors' customers interfered with.
Competitors' employees bribed.
Competitors' employees induced to leave employ.
Espionage of competitors.
Estimates—bogus or spurious requests for.
Intimidation of competitors.
Lessors induced to terminate leases of competitors.
Misrepresentation or disparagement of competitors' products, methods, financial standing, etc.
Prices of competitors misquoted.
Products of competitors interfered with.
Purchases made to embarrass competitors.
Restricting source of supply of competitors.
Sale of competitors' deteriorated product.
Substituting own goods for competitors.
Successor of competitor—claiming to be.
Trade secrets of competitors acquired.

Contributions: See Bribery.

Entertainment: See Bribery.

Espionage: See Competitors.

False Representation: See Misrepresentation.

Importer: Falsely claiming to be.

Labels: See Trade Marks.

Mail Order Houses:
Practices aimed to injure mail order houses.
Practices in behalf of mail order houses considered unfair.

Manufacturer: Falsely Claiming to Be.

Misrepresentation of Goods Offered for Sale:
City, state or county of origin or manufacture.
Condition—old offered as new.
Condition—repaired offered as new.
Condition—reconstructed offered as new.
Endorsement of Product Falsely Claimed:
By government or department thereof.
By individuals or associations.
Quality Content or Effectiveness:
By misleading trade names or brands.
Service in conjunction with goods.
Union Made, When Not.
Value—Fictitious and excessive price markings.
Of municipal bonds.
Of shares of stock and properties of corporation promoted.

Weight—misrepresentation as to.

isrepresentation of Plant Facilities and Equipment.

onopolies:
Combinations of competitors, including acquisition of control of competitors.
Competing with customers as means of coercion.
Concealing control of supposed independent.
Purchasing agency formed to monopolize buying.
Restrictions on articles sold, leased, licensed or loaned. (See Selling Methods.)

ames:
Fictitious trade names used.
Government, association or individual endorsement falsely indicated.
Manufacture or wholesale of product falsely indicated by name. (See also "Manufacturer," "Importer.")
Simulation of competitors:
Corporate or business name.
Trade name.

tents:
Consent decrees obtained for fraudulent purposes.
Exclusive rights falsely claimed.
"Patented" falsely imprinted on product.
Threatening suit for, or falsely claiming infringement.

ice:
Fixing to establish uniform resale price.
Discrimination in price based on—
Advertising.
Conditions of sale.
Credit—falsely claiming no extra charge for credit.
Location or territory.
Quantity purchases.
Restricted use or restricted sale of competitors' products.

oduct, Simulation of Competitors'.

rchasing Methods:
Coercing manufacturers to guarantee against decline in price.
Competitors' products bought up.
Conditioning purchase on manufacturers' refusal to sell to others.
Excessive prices paid to embarrass competitors.
Monopoly created for purchase of supplies.
Uniform prices for used automobiles.

ling Methods:
Average prices misquoted for comparison with own.
Bidding prearranged.
Combination sales (sale of certain goods below cost conditioned on purchase of other goods).
Competing with customers to coerce them to purchase from respondent.
Contracts falsely represented.
"Free" distribution of product.
Guaranteeing resale.
Legal advice furnished competitors' customers for contract evasion.
License fee paid if competitors' goods are not dealt in.

Lotteries.
"Money back" guarantee not observed.
Orders exaggerated to deceive jobbers.
Rebates of payments to competitor.
Refusal to sell to dealers handling competitors' products.
Refusal to sell to mail order houses.
Refusal to sell except in conjunction with other closely associated article.
Restrictions on articles, sold, leased, licensed, or loaned, i.e., "tying clauses."
Sales below cost to embarrass competitors.
Shipping goods without orders.
Special sales and reduced prices falsely advertised.
Territory divided with competitors.

Store Fronts, Signs, Windows, etc., Simulation of Competitors.

Trade Marks and Labels, Simulation of Competitors.

Capper-Volstead Act of 1922

This Act modifies the Sherman Act in that it **legalizes associations of producers of agricultural products** dealing in such commodities. The conditions necessary to make such an organization legal are: (1) that they shall be operated for mutual benefit; (2) that they either allow each member only one vote or do not pay dividends in excess of 8% annually; and (3) that they do not deal in agricultural produce of non-members to an amount greater than the total of their own members.

Dumping Act of 1916

Dumping Act of 1916 forbids the systematic dumping of foreign goods in the United States **at prices below the actual or wholesale market price** of the country of origin at the time of their exportation. Such dumping is construed as unfair trade and competition if it is done with intent to injure, destroy, or tends to prevent the establishing of such an industry in the United States; or if it results in monopoly or restraint of trade in those goods in the United States.

Webb Export Act

The Webb Export Act **limits the Sherman Anti-Trust Act** in so far as it relates to the export trade. The Act is for the purpose of promoting export trade of the United States, and declares in Section 2 that the Sherman Act does not apply to associations actually engaged in or organized solely for the purpose of carrying on export trade if—

1. There is no restraint of trade within the United States.
2. There is no restraint of the export trade of any domestic competitor of such person or association.
3. Such export association does not in any way, within or without the United States, do any act which intentionally or artificially increases or decreases prices in the United States of the goods exported.

The Webb Export Act also enlarges the jurisdiction of the Federal Trade Commission by prohibiting unfair methods of competition in the export trade by American firms against American competitors even if done in foreign countries and which ordinarily would be outside of the territorial jurisdiction of the United States (40 Stat. 516, Section 4).

SECTION 28

INVESTING SURPLUS FUNDS

The purpose of this section is to give a practical working knowledge of th investment security market which will be of assistance to financial managers The information given has been selected primarily with a view to enablin those who are charged with the investment of corporation surplus funds t avail themselves more readily of the services of banking connections, investmen banking houses, independent financial services, etc.

USE OF SURPLUS FUNDS.—The term "surplus" as used in this chapte has little bearing on the term "surplus" as viewed by the accountant. A cas balance may be available even when the balance sheet shows a corporate deficit Surplus cash or funds, then, may be defined as the actual cash on hand in exces of the amount required to maintain adequate bank balances to protect ampl lines of credit, and finance current operations. The acquisition of such fund may or may not be directly under the control of the financial manager, but, on of his duties is to make them as productive as possible, while, at the same time not in any way jeopardizing their availability for such needs as may arise They can be, and frequently are, left in bank subject to check, but as such they command a relatively low return, and it is expedient that they be place otherwise in order to increase the return.

When such a course is decided upon, this "surplus cash" becomes "invest ment funds," and a serious problem arises as to just how it should be investe At such times, advice will be plentiful from all sides, including corporatio directors, officers, banks, and as many security dealers as may learn that inves ments are under consideration. This advice will vary widely, and its diversit will ultimately throw the financial manager back upon his own judgment.

SOURCES OF INVESTMENT FUNDS.—In the main these investment fund will accumulate or arise from the following sources:

Sale of capital assets
Proceeds of new securities sold
Sinking fund reserves
Cash held for current dividends, interest, etc., especially in a business th receipts of which are of a seasonal nature
Reserves to assure regular dividends in future years
Reserves for taxes
Reserves for insurance and other contingencies
Employees' savings, pension, and other benefit funds
Cash acquired for future construction planned
Other cash withheld from distribution, but not to be invested immediatel in the business

INVESTMENTS ON TEMPORARY OR PERMANENT BASIS.—The fir question to be decided is whether or not investments should be on a temporar

or a permanent basis. Generally, investments on a permanent basis are advisable only for concerns of an institutional character, where endowments or like funds are to be retained intact, regardless of periodic fluctuations in business. Temporary investments (investments that may be readily liquidated, as opposed to investments that may have merely early maturities) are preferable for practically all industrial, commercial or trading concerns. These organizations must maintain a thoroughly **liquid position** in order to be prepared to take advantage of trade needs and opportunities as they arise.

The above advice treats all surplus cash as working capital, and assumes that the time when it will be needed in the operations of the business cannot be determined beyond the period of a very few months. But a review of the sources of accumulation, as tabulated above, indicates that in some instances surplus cash will be available which may properly be invested in longer term securities, on which higher returns are obtainable than can be had on bank time deposits, acceptances, etc.

The most frequently employed **types of securities** are included in the following list:

U. S. government certificates of indebtedness and notes
U. S. government bonds
Bank acceptances
Bank certificates of deposit
Commercial paper
Called bonds for redemption for which funds are on deposit with trustees
Short-term notes and early maturing bonds of established and recognized industrial, public utility, and railroad corporations, cities, counties, states, and foreign governments.
Railroad equipment trust certificates
Real estate mortgages
Intermediate term bonds (2 to 10 years)
Long-term bonds
Preferred stocks
Common stocks

Temporary Investments

U. S. GOVERNMENT OBLIGATIONS.—These represent absolute safety of investment in so far as that is attainable, and thus reflect to a greater degree than any other type of security the actual cost of borrowed money. During and immediately after the World War, **Liberty and Victory bonds** were purchased in unusually large amounts by corporations, as a matter of patriotism. Because of this, even the most conservative bankers who ordinarily insist that only those items which will be liquidated in the ordinary course of business may be listed as current assets place Liberty bonds in that section of the balance sheet. Many of these Liberty bonds have since been disposed of in one way or another, but they always maintain their position as the surest and most liquid investments of any corporation.

It is nearly always possible to obtain short-term U. S. government bonds, notes, or **certificates of indebtedness.** They are issued from time to time to take care of current Treasury needs. Of late years they have been available in a great variety of maturities, because of the large Treasury operations in adjusting and consolidating the swollen national debt. Their almost complete freedom from risk should never be lost sight of, and though higher rates can be had, the difference in the very early maturities is so small as always to entitle them to favorable consideration for purposes of temporary investment.

BANK ACCEPTANCES.—These acceptances are being more widely recognized as one of **the safest and most attractive short-time investments** on the market. They are included in the daily offerings of some large investment banking houses, discount houses and acceptance banks. On the acceptance as an investment the International Acceptance Bank says:

"In regard to the security of bank acceptances we cannot do better than to quote from an article published some time ago by the First National Corporation: 'From the point of view of security, a bank acceptance is analogous to a certified check, in that it constitutes a primary obligation of the drawee and of any endorsers whose names may appear upon it. Unless issued to create dollar exchange, in which case the drawer must be a bank or banker, it is always based upon a commercial transaction, supported by the customer's agreement with the bank to place the latter in funds in advance of maturity, and often by his pledge of actual goods involved. In due course, it is liquidated by the sale of goods and is, therefore, essentially self-liquidating. But the holder of a bank acceptance is not dependent upon the completion of the commercial transaction for the collection of his funds, since his paper is the direct, unconditional obligation of the accepting bank to pay. It is secured by the bank's entire resources, and must be honored, even though the taker of credit should default on his part of the undertaking. The security of principal is, therefore, of a high order, and, where the accepting bank is well known, the question of safety is rarely raised.'

"A great advantage of bank acceptances is that they may be procured to meet almost the exact requirements of any maturity up to six months, and that furthermore, should it be desired to realize upon the investment before the anticipated maturity, bank acceptances, if held by a third party, are salable in the open market at a moment's notice with the holder's endorsement and if endorsed by a member bank or other approved name as third party, they are bought freely by the Federal Reserve banks. In this way they combine adaptability to various needs with the highest degree of liquidity.

"All national banks are permitted to invest in bank acceptances without regard to the 10% limitation of loans to one borrower, which is imposed by the National Bank Act and which applies to purchases of single-name commercial paper. Moreover, State banks and trust companies, as well as savings banks and insurance companies, are being given the right to buy such paper in an increasing number of States, and during recent years, the acceptance has become extremely popular with these and other large corporations, as a means of affording liquidity, security, and at the same time, a good yield for their short-time funds."

BANK TIME DEPOSITS AND BANK CERTIFICATES OF DEPOSIT.—Time deposits and certificates of deposit are practically the same, only differing in that the one is in the form of an account and the other is evidenced by a certificate. The rates on them vary considerably in different sections of the country, usually being lower in New York than in other localities. This medium of investment is **well suited to the temporary employment of funds.** There is, however, the chance of some loss of interest in the event that funds are withdrawn prior to the specified date. There is also the ever-present possibility that the bank of deposit may exercise its legal right to hold funds to the maturity of the certificate, or delay re-payment of a time deposit a certain number of days after notification of withdrawal as set forth in the deposit agreement. Such difficulties are so rarely encountered, however, that money on time deposit is generally regarded as immediately available.

COMMERCIAL PAPER.—This is one of the chief forms of short-time investment used by banking institutions. As it describes the securities quoted daily in the financial sections of metropolitan newspapers, the expression "commercial paper" designates notes of business firms and corporations **sold through brokers,** or sold directly to houses who buy commercial paper and re-offer it to banks and others who desire liquid, short-time investments. If the notes have been endorsed by the drawee, they become **two-name paper.** When both drawer and drawee of the note are of recognized credit standing, the notes become "two-name paper; best names," and as such, command a low rate.

The **degree of safety** of commercial paper as indicated by long experience is high. Thus a prominent New York trust company which had purchased upwards of $200,000,000 market paper in 10 years, suffered losses on that amount of only about 1/40 of 1%, or $50,000. However, commercial paper, by its very nature, involves much greater risk on the part of the purchaser than do prime bank acceptances, and in choosing between the two, it is doubtful if the income which a corporation derives from outside short-time investment is of sufficient importance to warrant the assumption of the added risk.

Commercial paper is marketed principally through established commercial paper houses in the larger cities of the country, and can be obtained either through them, or through the services of metropolitan banking connections.

CALLED BONDS.—This class of bonds, for the redemption of which funds are available, or maturing bonds, for which provision has already been made either through sale of other securities or accumulation of cash, constitute **desirable temporary investments.** They can occasionally be obtained from dealers who have accepted them in exchange for other securities. Maturities will usually be no more than **two months distant,** though sometimes longer. For example, the Baltimore & Ohio Railroad sold $75,000,000 First Mortgage 5s in August, 1924, to provide for retirement of a like amount of Prior Lien 3½s, due July 1, 1925.

SHORT-TIME NOTES AND EARLY MATURING BONDS.—These include a wide range of maturities from 6 months to possibly as long as 6 or 8 years, although the securities known in bond circles as "short-time stuff" are rarely of longer terms than 4 or 5 years. They are **in great demand** by financial institutions, trustees, corporations, and individual investors who carefully diversify maturities. A short-time issue may sell on a much lower yield basis than a longer term issue having exactly the same security, just as the Missouri Pacific Railroad First and Refunding 5s, due August 1, 1926, were selling early in 1925 at 101¼, to yield 4.80%, while the 5s due 1965, secured under the same mortgage, sold at 85½, to yield 5.95%. Well known short-term bonds and notes reflect to a marked degree their actual safety in market price. It is possible to foresee clearly the maturity date, and if redemption appears certain, the price level will be close to par, while if there is any uncertainty in the situation, the price will be substantially below par. Thus in the latter part of 1924, though President Byram of the Chicago, Milwaukee & St. Paul Railway was widely quoted as stating that no reorganization was under contemplation, still the road's General and Refunding 4s, due June 1, 1925, sold around 74½, reflecting doubt on the part of the investing public. On March 18 the road was placed in the hands of receivers.

Notes and short-term bonds are issued for many purposes and these purposes should be closely scrutinized by prospective purchasers because the **means of redemption** should be apparent at the time. If the borrowing corporation or government has long-term bonds outstanding, it will be well to note their

investment and market position as an indication of ability to accomplish necessary refunding. In times of high interest rates, strong companies frequently find it expedient to improve their current credit and working capital situation by short-term financing. Under such circumstances, only the most firmly established business should be favorably considered by the investor, and it should be that fixed assets are ample to provide a basis for any financing found to be necessary for redemption of the note issue—or that either serial or sinking fund redemption out of earnings is provided. An example of such financing was the Standard Oil of California 7s, issued in 1921 and due in 1931, which were called in 1923 and refunded with 5% bonds. Notes may also be of a commodity collateral nature, similar to Copper Export Serial 8s, issued to assist the large copper producers in carrying temporarily excessive stores of refined copper. The Sinclair Crude Oil Purchasing 6s, due 1928, are another example. Though not actually secured by the commodity, the company covenants to maintain quick assets (as specified) equal to 125% of aggregate liabilities. Many other examples can be found, and in all those commanding prices around par, it will be seen that payment at maturity is almost a certainty.

Such securities have a **ready market** and **fluctuate but slightly** in price so that they are suitable for investment as reserves for dividends to be paid in future years, parts of insurance and benefit funds, and cash held for proposed construction.

RAILROAD EQUIPMENT TRUST CERTIFICATES AND NOTES.—Although properly coming under the heading of "railroad bonds," these constitute an unusual type of security, and are regarded by so many investors as occupying a class alone, that they should receive special comment. These securities are discussed by the National City Company in a pamphlet as follows:

"Issued under properly drawn instruments, either the so-called '**Philadelphia Plan**' or an **agreement of conditional sale,** these equipment trust certificates are protected as to security by an absolute title to valuable railroad equipment, which **title is vested in the trustee** until all outstanding certificates and dividend warrants have been paid and all obligations under the trust agreement discharged.

"In creating an equipment trust, a certain percentage of the purchase price is paid in cash by the railroad company. . . . In most of the recent trusts the cash payment has been 20% to 25%. This means that from the very beginning there is a substantial equity in the trust equipment that protects the trust obligations issued against it. As the trust obligations are usually issued with serial maturities, and these are paid off more rapidly than the equipment depreciates in value, this equity instead of growing less, constantly increases, so that the later maturities as the maturity date approaches become the most valuable from the standpoint of safety.

"The real test of a security, after all, is the treatment accorded in the case of financial difficulty of the issuing corporation. The general rule is, that equipment trust agreements in case of receivership are carried out according to their terms. Should the railroad company be guilty of a violation of any of the terms of the trust agreement constituting a default, the trustee has the right at once to take the equipment.

"Title to the trust equipment being vested in the trustee until fully paid for, it has been well settled by decisions of the United States Supreme Court that the after-acquired property clauses of the carrier's mortgages cannot attach so as to give such mortgages a lien on the equipment, as such lien can attach only to property to which the carrier has title.

"Another excellent feature of these obligations is their market stability. The price fluctuations of the early maturities are very slight and the price movement of the longer maturities is as closely related to the money rate as is the price movement of the very highest grade long term mortgage bonds. . . . Probably no form of investment has a stronger economic background of necessity than equipment trust certificates, issued to pay for rolling stock used on American railways."

REAL ESTATE MORTGAGES.—These constitute one of the oldest forms of investment securities and are recognized as one of the safest. Computations showing the aggregate investment of the larger life insurance companies in this country indicate that approximately 50% of their funds are in real estate mortgages and real estate mortgage bonds. If their degree of safety is judged by considering the character of other insurance company investments, it will be apparent that for an equal security, real estate mortgages **yield a greater return** on invested capital. In considering their suitability for the employment of corporation funds, however, it is important to observe that they **lack marketability.** This is especially true of single mortgages, and even in the issues of **real estate mortgage bonds,** which frequently run into millions of dollars for a single issue, their market usually depends upon the single firm by which the bonds were originally distributed. Some of the houses which specialize in first mortgage real estate bonds have splendid records, and they are constantly improving the marketability of this class of security. The reputation and record of the underwriters is of the greatest importance in studying bonds of this class.

This type of investment, if selected with the utmost care, may be suitable for employees' savings and benefit funds, and for reserves set up to insure dividends in future years. But such funds should also include a large amount of more readily salable securities in order to assure the availability of ample funds for any emergency.

INTERMEDIATE TERM BONDS.—These are securities maturing within approximately 7 to 12 years, and because they are in demand by neither institutions seeking short-time investments nor savings banks, insurance companies, individuals, etc., seeking long-time investments, they frequently afford attractive opportunities when chosen with careful consideration, not only for safety but also for immediate and prospective market position. They are well suited to the investment of money laid aside for construction and new properties in future years, as well as for other funds which are not to be used in financing current operations.

When **serial bonds** are sold, investment bankers frequently find that the early and late maturities are taken first, while the intermediate maturities, unless offered at very attractive prices, may be a drag on the market. Examination of seasoned issues of intermediate maturity frequently indicates that they are selling at very attractive prices. For example, early in 1925 the Baltimore & Ohio 6s, due 1929, sold at 103¼, to yield 5.10%, while Baltimore & Ohio 4½s, due 1933, having approximately the same investment status, sold at 92, to yield 5.75%. A purchaser of the 4½s maturing in 8 years may reasonably expect that within 4 years his bonds will still sell at a 5.75% basis, or a price of 95½. By that time, however, they will be "4 year bonds," and in such demand that, other things being equal, they may be expected to sell at a 5.10% basis, or a price of 97¾. If disposed of then, the yield will have been much more than the 5.75% originally anticipated.

LONG-TERM BONDS.—These should be purchased only after a careful examination of their immediate investment status, and considerable thought as to what developments future years may bring for the obligor. It is impossible to foresee definitely what conditions may prevail at the time of their maturity, and for this reason it is highly important that their status with respect to security be **checked at more or less frequent intervals.** It is a common occurrence that investors who purchase securities only after long and thorough investigation will place them in strong boxes and consider the work of investment completed. Then at some time in the future years, a coupon is returned, marked "No Funds Available." By that time, the worst has occurred, and the company has probably already been placed in the hands of a receiver. But business failures of large corporations, particularly those which make public the details of their financial conditions from time to time, usually may be foreseen sufficiently far in advance to save the greater part of the ensuing loss.

For an equivalent change in "yield to maturity" the prices of long-term bonds fluctuate much more widely than do the prices of short-term bonds. For example, the price of a 60-year 4% bond selling on a 5.50% basis is 73¾ and the price of the same bond on a 5% basis is 81. On the other hand, the price of a 5-year 4% bond on a 5.50% basis is 93½ and the price of the same bond on a 5% basis is 95⅝. In one case there is a change of 8¼ points, and in the other only 2⅛ points. In a later paragraph, under the heading "The Movements of Bond Prices," the fact is brought out that bond yields fluctuate with the **changing phases of the business cycle.** It will be evident that by shifting funds back and forth between long- and short-term bonds, the astute trader can make substantial profits. If these investments are confined always to the highest grade securities, there is little chance for monetary loss. In a period of high interest rates and low bond prices, the long-term issues should be purchased. When interest rates have fallen with a corresponding rise in bond prices, the bonds originally purchased may be profitably disposed of and the money re-invested in short-time issues to be thus held until another period of high interest rates prevails, when the long-term bonds may again be bought for the rise. It is to be observed that such trading requires the devotion of much time and study to the subject and the best practical advice available on economic conditions should be obtained.

PREFERRED STOCKS.—These are purchased by many investors who feel that the return on high-grade bonds is too low, and are yet unwilling to assume the speculative risks believed by many to be inherent in the ownership of common stocks. At the present time (1925) **public utility preferred shares** are in particular vogue and, on the whole, they have been very desirable investments. It has come to be an accepted policy in financing utilities that the property may be properly bonded to form 60% to 75% of the construction cost and the remainder of the needed capital supplied through sale of preferred stock, leaving the common stock as a capitalization of earning power. As a matter of fact, the better preferred shares in this group have from $200 to $400 property value behind each $100 share after deducting the par value of all funded debt, using generally appraisal figures for property value. Many utilities in all parts of the country have carried on successful campaigns for so-called "customer ownership" through sale of preferred stock in the territories which they serve. Obviously, such procedure greatly enhances the companies' good will, and has helped to popularize this class of investment.

A large number of railroads have no preferred stock issues, and many of such security issues which are outstanding were originally the outgrowth of reorganization. Most of the **railroad preferred stocks** available have been

outstanding for a number of years, and have thus become well seasoned in investment and market position, so that the genuine investment issues among them are not difficult to select. On the whole, financial managers of railroads appear to find it more expedient to obtain new capital through the sale of bonds, common stocks, or convertible bonds which they hope will later be converted into common stock.

Industrial preferred stock issues have come to be a familiar part of the security market. Some of them, such as U. S. Steel and General Motors preferred stocks, have large equities and are backed by earnings many times the dividend requirements. Our greatest industrial organizations, however, have grown principally through the plowing back of earnings into property. Their original plans for financial structure have not usually included provision for preferred shares, but the preferred issues do work into situations when new capital is needed which common stockholders are hesitant about providing, or when great consolidations are financed. As a whole, new issues of this type offered in recent years have not an inspiring record. Professor Dewing of Harvard reports that the results of an investigation showed that out of 607 industrial preferred issues offered to the public between June 1, 1915, and June 1, 1920, it was found that by January 1, 1923, no quotation could be found for 70; 114 were quoted at less than 25% of par; 169 were quoted between 26 and 90; while 200 were worth 91 or more, and 54 had been retired.

Some corporations invest a portion of their employees' benefit funds in preferred stocks, but they should be chosen with the greatest caution. As a class they are barred from a share in management of the business, from larger earnings which may accrue to common stocks, and in the event of receivership, their position is very weak as compared with secured bonds.

COMMON STOCKS.—These as a class have long been regarded as the **greatest single medium of speculation,** characterized as they are by wide fluctuation in market values and the risk of varying profits inherent in ownership of a business. The feeling has become imbued in a large body of investors that only funds on which they could afford to "take a chance" should go into even well seasoned common stocks, while the real "investment funds" should be placed entirely in high-grade bonds. This long established principle has been occasionally shaken by earnest students of the subject and a great deal of comment along this line has been caused recently by a book entitled "Common Stocks as Long Term Investments," by Edgar Lawrence Smith.

Mr. Smith's investigations, covering the last 60 years, indicate in a rather conclusive manner that, in the long run, investors in seasoned and diversified common stocks have in the past fared much better financially than have investors in high-grade bonds. It should be noted, however, that this treatise was undertaken and is presented for the individual investor, and its conclusions while pointing out certain merits of common stock investments, do not by any means indicate that bonds are obsolete as investment securities. In fact, Mr. Smith makes the following interesting comments regarding the investment of banks and insurance companies, which will apply in large part to corporation outside investments:

"Their investments are all made to protect dollar obligations. Their sole concern is so to conduct their affairs that they will always have available more dollars than they will be called upon, under their commitments, to pay out, at the same time deriving a profit above operating expenses. It is natural and right that the highly trained specialists whom they employ to guide them in their financial policies should concentrate their attention upon promissory obligations payable in a fixed number of dollars, amply safeguarded against

the shrinkage in value of the particular properties by which they are secured, even though they are not in the least safeguarded against the possible shrinkage in the purchasing power of the dollar itself. These financial institutions are also subject to the necessity, at times, of converting a very substantial part of their investments into liquid or currency form, which is not normally true of the individual investor who has the future welfare of his family as his main investment purpose.

"These institutions are called upon periodically to present a balance sheet of assets and liabilities in the form of annual statements, etc., and cannot afford to take the chance of having their security holdings show temporary shrinkage in market."

The purchase of common stocks of affiliated and subsidiary companies when deemed expedient will nearly always be a matter of business policy, and will be made from funds which do not come strictly under the heading of investment funds as described at the beginning of this chapter. Some large and successful corporations have substantial outside common stock holdings. For example, E. I. du Pont de Nemours & Co. owns a large block of General Motors Corporation Common, and the du Pont interests have for some time been closely identified with the management of General Motors. Union Pacific Railroad is a heavy owner of stocks of other railroads, a part of which were acquired when it was forced to relinquish control of Southern Pacific. The United States Steel Corporation, on the other hand, carries $100,000,000 United States government bonds as an investment of its depreciation and depletion reserves.

General Investment Principles

DISTRIBUTION OF RISK.—The distribution of risk or "**diversification,**" as it is sometimes called, is recognized as one of the cardinal elements of sound investment. This does not mean than an investment of $20,000 should be distributed among 40 different issues in denominations of $500, but for such an investment, the selection of 5 issues in amounts of $4,000 each would be reasonable. The degree of diversification depends somewhat upon the average conservatism of the investor. For one who is perfectly willing to accept the low rate available on U. S. government bonds, the factor will be unimportant, although even in that event it will be found advantageous to distribute the investment among various maturities, since even government bonds vary in price with changes in the general level of interest rates. An investment account consisting largely of securities other than U. S. government bonds should be distributed among the various types of securities, namely, railroad, public utilities, industrial corporation, foreign governments, real estate mortgage bonds, etc., and diversified preferred and common stocks, if they are found to meet the given requirements, considering in each case the suitability of the particular type of security.

Within the various groups the element of diversification should be continued. For example, in purchasing railroad bonds, it will be found that different roads are dependent to a greater or less extent upon certain kinds of traffic, and it would be wise to select them with this point in view. The **diversification as to maturity** is also of considerable importance, because the constant reinvestment of funds arising from maturing bonds places one in a position always to take advantage of such opportunities as may arise. There is also the importance of **geographical distribution.** For instance, if all funds should be invested in securities of hydro-electric companies depending upon one section of country for water supply, a severe drought or lack of snowfall in the mountains might

seriously affect net earnings of all the companies; or the market for real estate mortgages, all secured upon property in and about one large city, might be harmed by a severe local industrial depression. In a list of securities selected with the principle of diversification in mind, there will always be a substantial amount which can be readily marketed without loss, no matter what situation or conditions may prevail with respect to money rates in general.

MARKETABILITY.—This is another desirable factor, which, as already stated, must be paid for in one way or another, and for a corporation is well worth the cost. A **ready market** is established in many ways, and depends upon such varying factors as the amount of the issue outstanding, the reputation of the borrowing company among investors throughout the country, the character of investment distribution which is accomplished by the underwriters of the issue and security dealers throughout the country, the operations of a sinking fund, and whether or not the issue is listed on an exchange. These are all points which should be inquired about in considering any investment security. It is not wise, however, to place too much emphasis on the matter of stock exchange listing, because some of the largest and best known bond issues which have ready markets in practically every important city are not listed.

NOMENCLATURE OF BONDS.—The name of a bond issue should always be selected with the greatest care, since from the name alone, considerable should be learned regarding the exact nature of the security. These names or titles, however, may be very misleading, and will therefore bear careful study. In the following list is given the meaning of the more common bond names.

A Mortgage Bond is secured by definite pledge of physical property.

A First Mortgage Bond is secured by property, and has first claim against earnings of the pledged assets and against the property itself in the event of liquidation.

Second and Third Mortgage Bonds have claims against property covered in the order named.

A First and Refunding Mortgage Bond must be a first mortgage on some part of the company's property, but the amount of property on which it is a second or third mortgage may be much greater than that on which it is a first mortgage. The word "refunding" simply means that the issue provides for refunding other outstanding bonds. (See "Refunding Mortgage" below.)

A First Mortgage Secured or **First Mortgage Trust Bond** is one secured by deposit with a trustee of first mortgage bonds.

A First Lien Bond may be a first mortgage bond, or it may be only a first lien on a portion of the company's property by virtue of certain **first mortgage bonds pledged as collateral.** The error is sometimes made of considering "first lien" as synonymous with "first mortgage," but such is not the case; the security behind a first lien bond should be carefully examined.

Purchase Money Mortgage Bonds are secured upon property purchased by the corporation and are frequently issued in order to escape restrictions of a previous issue which requires that **"after acquired" property** should be pledged under it.

A Refunding Mortgage is one which provides for retiring and refunding the various outstanding underlying mortgage bonds. It may authorize the issuance of a limited amount of bonds and make special reservations for amounts necessary to refund specified issues, or it may on the other hand be a so-called **"open end mortgage."** In the open end issues, it is customary to provide that additional bonds may be issued to refund maturing bonds and to provide

additions, improvements, and betterments up to 75 or 80% of their cost. In examining such a bond issue, it is well to note the issuance restrictions, and also whether or not provision is included to the effect that no more bonds of underlying issues may be sold to the public.

A First Refunding Mortgage Bond will probably not be secured by first mortgage on any property whatever—the word "first" simply meaning that, of the refunding mortgage bonds which the company has issued or may issue, this is the first in number. The term is often misleading, but bond underwriters frequently take advantage of any excuse to use the word "first."

Prior Lien Bonds are simply bonds which have prior claim over some others. In many cases, they are junior themselves to lesser or greater amounts of underlying bonds.

Consolidated Mortgage Bonds are bonds secured upon properties that have been consolidated. There may be variations of this name such as **consolidated first mortgage bonds** meaning a first mortgage on consolidated properties; **first consolidated mortgage bonds** meaning the first in number of consolidated mortgages; or **first and consolidated mortgage bonds,** meaning a first mortgage on part of the property and junior mortgage on other consolidated properties.

Unifying Mortgage Bonds, as a title, are virtually synonymous with "consolidated mortgage bonds" and the same variations may be found.

Extension Bonds are found principally in the railroad field and usually designate bonds secured on branch or main line extensions into new territory.

General Mortgage Bonds are usually secured by a blanket mortgage upon most, if not all, of the company's property, subject to underlying divisional and other outstanding mortgage bonds. The majority of such issues also provide for refunding underlying bonds. They are often called **general and refunding,** and in such cases the underlying obligations should be studied.

Development Mortgage Bonds and **Improvement Mortgage Bonds** provide for financing development and improvement, as the names imply. They nearly always are also of the character of general and refunding mortgages. These names are frequently combined into **development and general mortgage, refunding and improvement mortgage,** etc.

A Collateral Bond or **Collateral Trust Bond** is one secured by pledged bonds or stocks. They are often issued to finance ownership of controlling stock interest in one company by another. In such cases they may be found to rank about with debenture bonds of the issuing company, because in most instances, a receivership would find the stock pledged to be of small value as the ultimate security.

A Debenture Bond is an unsecured promise to pay. When a corporation issues debentures, it frequently protects investors by a covenant to the effect that it will not in the future pledge or mortgage any of its assets, unless equal provision is made for the debentures. This is called the **"negative pledge clause,"** and while some fairly good issues do not contain it, it is certainly an important safeguard.

A Convertible Bond is usually convertible into preferred or common stock of the company under stated terms. They are generally debenture obligations, and have been highly profitable investments, by virtue of their convertibility, in many instances. They should be bought, however, only on their investment merits.

Receivers' Certificates are issued by the receiver of a company in financial difficulties, and seldom are for periods exceeding 5 years. As an expense of the receivership, they have prior claim against the assets of the company, and are usually highly regarded by investors.

Adjustment and Income Bonds are generally the outgrowth of reorganizations. Interest payment on them is not a fixed charge, but is contingent upon its being earned and declared by the directors. They are thus somewhat of the nature of preferred stocks, and may or may not be cumulative.

Guaranteed Bonds, as the name implies, are guaranteed or **assumed** by some other company. A guarantee may raise a weak mortgage bond to a high investment rating by placing behind it credit of recognized strength, but if one looks ahead to possible receivership of the guaranteeing company, it is well to note what other security the guaranteed bond has.

Railroad Terminal Bonds are the obligations of companies set up by one or more railroads that own and operate important terminal properties. In general, they constitute well secured investments, and are frequently guaranteed by the proprietary railroads, in order to enhance the investment position of the bonds.

Closed Mortgages are those under which no additional bonds may be issued. An investor in them is assured that his security cannot be diluted by heavy borrowing on any equal security basis in the investment market in the future. Bonds of closed issues frequently attain a scarcity value which enhances their market position.

Gold Bonds, when the term is applied to bonds payable in U. S. funds, means that the principal and interest are payable, upon demand, in U. S. gold coin of present standard weight and fineness. After seeing bonds in nations such as Germany become almost valueless because they were payable in depreciated currency, the advantage, in a possible emergency, of owning gold bonds is fully apparent.

Bond Prices and Bond Yields

CALCULATION OF YIELD.—Bond prices should be regarded as functions of yield, which they actually are, and in buying a bond the yield to maturity should be given primary consideration rather than the price itself. The factors which determine yield are price, maturity, and nominal or coupon rate. Yield is the only common basis of comparison for all maturing obligations. For example, in April, 1925, Louisville & Nashville First and Refunding 4½s, due 2003, were selling at 94½, while the 5% bonds, secured under the same mortgage, and also maturing in 2003, were selling at 105. The prices themselves gave no indication as to whether or not one bond was a more attractive purchase than the other. Reference to the yield tables, however, showed that at the prices named, the yield on both issues was almost exactly 4¾%, indicating that they were equally favorable purchases at that time.

The **exact calculation** of yield involves long mathematical processes of little interest to the investor, but the following brief definition may help to clarify the subject. If it is considered that a bond is actually composed of a number of promissory notes of which the face of the bond is one note and each coupon a separate note maturing on different dates, and if it is then considered that in purchasing a bond the investor actually discounts each individual note (compounding semi-annually), then the yield is that rate of interest at which the present worth of the face of the bond, plus the present worth of each coupon, will equal the present cost of the bond. The amount of interest accrued since payment of the last coupon is generally added to the cost of the bond, but accrued interest is not considered in computing yield.

An **approximate method** of figuring yield which gives an idea of its make-up, but contains some inaccuracies corrected in computing the tables, is supplied by the financial editor of the New York *Herald Tribune* as follows:

"To figure the precise yield on a bond, it is necessary to use yield tables, but the approximate yield can roughly be figured out by the following formula: Divide the closing quotation on a bond into the rate of the annual return. If a bond is selling below par, you must allow also for the appreciation of the principal. To do this, subtract the market quotation from par, or 100, and divide the remainder by the number of years the bond has to run before maturity. For example: If a 6% bond is selling at 90 and has 10 years to run, the annual return will be 6.66%. The difference between par and the market price will be 10 points, subtracting 90 from 100. Divide 10 points by 10 years, the quotient will be 1. This figure is to be added to 6.66%, which is the annual return, and the result, 7.66%, will give you the approximate yield."

The exact yield from the tables would be 7.43%.

It is to be noted that actual prices serve the purpose of bond trading and of shading yields up or down, and it will also be observed that in long-term bonds, a large change in price causes a relatively small change in yield, while in the early maturities, a small change in price will cause a relatively large change in yield. This point should always be kept in mind in considering the future market position of any issue.

Nowadays most large banks have bond departments which can supply yields on any bond at current quotations, and investment security dealers will also be glad to supply such information. The market position of bonds should be judged by yields and comparisons with other issues of similar character made on that basis. Such comparisons will frequently show that issues selling above par carry higher yields than those below par. This is partly due to the fact that many individuals will not take the trouble to amortize systematically a premium, but want always to see their capital grow. Consequently, many genuinely attractive investments can be made in bonds selling above par, and such opportunities should not be lost sight of.

MOVEMENTS OF BOND PRICES.—These movements have been the subject of much theorizing, and it is perfectly evident that with changing levels in interest rates, the general levels of bond prices do rise and fall. It is an extremely difficult problem though to "catch the market." That is one reason why bond maturities should be diversified—such distribution will assure average good yields through all the ups and downs of the market. On this interesting subject Professor Vanderblue of Harvard says:

"When the business cycle enters the prosperity phase, the demand for funds for industrial enterprise becomes increasingly heavy. Commercial paper rates tend to rise. Investments in bonds are disposed of in the open market by banks, industrial concerns, and others to secure funds for business purposes, and as a result, bond prices fall—that is, bond yields rise. During the liquidation and depression periods of the business cycle, on the other hand, the inactivity of trade decreases the demand for commercial loans, and funds are released for the purchase of bonds. Commercial paper rates fall, bond prices rise, and yields fall. At such a time, commercial paper rates fall below bond yields, and it thus becomes more profitable to buy bonds than to loan money for short term transactions. Cheap money, in turn, tends to stimulate business, and leads to a repetition of these movements of business and interest rates."

Selection of Long-Term Bonds

RAILROAD BONDS.—These can be more readily selected and their investment position more easily checked up from time to time than other types of

corporate security. A wealth of information is available regarding them through long records of corporate development, maps, etc., published in various reference books, and monthly reports of operations and earnings to the Interstate Commerce Commission. Concerning their safety, Moody's "Analysis of Railroad Securities" says:

"Excepting government securities, railway underlying mortgages still rank at the top of the whole investment list. They are better secured by assets than most public utility issues and they are so well protected by earning power that the alternation of depressions and booms hardly affects their safety at all. They sell on a strictly income basis, and their prices decline but little except in panics when investors are selling anything salable, or in times when the general price of capital rises rapidly. They are a good cash equivalent, suitable for trustees and estates, and are as safe as money deposited in almost any bank."

An article on the subject of buying a railroad bond which appeared in Barron's *Financial Weekly* of January 7, 1924, contained the following:

"The prospective purchaser of a railroad bond needs to ask two questions to determine its relative safety: How remote is the likelihood that the road may go into receivership? What will happen to the bond in question, if it does?"

To answer the first question, a good map of the road, information regarding the character of traffic, and a record of earnings and their disposition over 5 to 10 years should suffice. A soundly constructed railroad should justify its existence by providing necessary transportation between traffic centers, or between points of origin of commodities, materials, and passengers, and their destinations. If its traffic is of a diversified nature, a depression in one industry will not cause difficulties such as hard times in the Northwest have helped to bring upon the Chicago, Milwaukee & St. Paul Railway. The earnings should show a healthy growth over a period of years. The **amount available for interest charges** must show a comfortable margin of safety (two times is a fair and average figure) and the amount carried to surplus and plowed back into the property should be sufficient to enhance equities gradually.

In taking up the second question, the **actual security of the bond** must be studied. Speaking broadly, the more mileage covered by an issue the better, and, other things being equal, a mortgage on main line is superior to one secured on branch line mileage. In more than one railroad receivership, unprofitable branch lines have been turned over to their bondholders and either abandoned or sold back at a great loss to the original investors. Even in the event that a road in whose bonds an investment is held does fail, the wonderful history of the railroads of this country will give one courage. Some of our strongest systems today have at one time or another passed through receivership—witness: The Atchison, Topeka & Santa Fé, probably the premier railroad of the United States.

PUBLIC UTILITY BONDS.—These as a class cover a wide range, including the obligations of electric, gas, telegraph, telephone, and traction companies. Railroads also are properly included in this group. The term "public utilities" as generally used, however, has come to refer specifically to **electric light and power companies.** The period covering the past 10 or 15 years is often spoken of as the "Age of Electricity." The tremendous growth in use of electricity has made necessary the raising of huge sums for new capital expenditure. Recognizing this need, public authorities have been generous in allowing companies to earn fair returns on property, and this right to earn a fair return on the value of property devoted to the business of providing public services has been frequently upheld in the highest courts of the land.

The progress of the electric industry has differed from the period of develop-

ment of some of our western railroads, in that modern investment banking methods have largely eliminated financial excesses, and have greatly helped in establishing the public utility industry on what appears to be a stable and firm foundation. It is generally felt that secured bonds of established and successful public utility operating companies form **one of the most desirable forms of long-time investment** available today. It is, nevertheless, true that considerable care should be exercised in the matter of choice. For general analysis purposes, a list of questions, under the heading "10 Tests of a Sound Public Utility Bond," printed in pamphlet form by Halsey, Stuart & Co., serves very well. The tests are as follows:

1. Is the territory served desirable?
2. Is the management capable and experienced?
3. What is the nature of the lien?
4. Do the earnings show a satisfactory margin of safety?
5. What is the valuation of the properties?
6. Are the mortgage provisions carefully drawn?
7. Is the franchise situation satisfactory?
8. Is the issue assured of reasonable salability?
9. Is the yield consistent with prevailing market conditions?
10. What is the character of the sponsors of the issue?

These are questions which may properly be asked before investing, and if the answers compare favorably with similar data regarding issues of recognized and undoubted character in the field, there is little chance of error.

Bonds of public utility holding companies are not in the same category with those secured upon the property of operating companies. Many of these holding companies have been formed to control several operating companies through common stock ownership. The holding companies issue bonds, either as debentures, or secured by the common stocks owned. In some cases, the pledged stocks actually represent little more than capitalized earning power, and, in any event, it is apparent that such securities are, as a class, not yet sufficiently established through years of depression as well as prosperity for the industry to warrant their classification among the highest grade bonds.

Trolley and interurban lines have been on the decline as a group, due, especially, to automobile and motor bus competition, and to increasing costs of operation. While a few companies in the traction field continue to be financially successful, and no satisfactory substitute has yet been found for rapid transit lines in congested metropolitan districts, the great number of failures in the traction group is an indication of the hazards involved in that particular division of the public utility field.

INDUSTRIAL BONDS.—These as a class of securities include the funded obligations of manufacturing, mining, trading, shipping, and all other corporations, except those of strictly public utilities, or steam railroads. Industrial securities are **more difficult to select and watch** than any other type because of the diversity of the nature of such enterprises and the countless unforeseeable factors which may inject themselves into an industrial situation. The majority of railroads and public utilities are vitally necessary to the every-day life of communities which they serve, and must continue to operate at all odds; but most industrial corporations could close down completely at almost any time, and there would be others ready immediately to take their places. For this reason the value of industrial concerns depends so greatly upon "going concern" value—it is a well known fact that in liquidations, industrial properties frequently have a cash sale value, amounting to only a fraction of their actual

cost. It is, therefore, evident that as a rule, mortgage bonds of industrial corporations are not properly issuable in so great a proportion to plant value as are utility and rail bond issues. Another principle which follows is that, other things being equal, bonds of corporations occupying prominent positions in basic industries are better than those of non-essential class. This rule has obvious limitations—witness the present (1925) depressed financial condition of the bituminous coal industry, due largely to over-expansion of the industry as a whole.

The **earnings of industrials** tend to fluctuate more widely than do those of utilities and rails, indicating that a wider margin of safety in earnings should be sought. Where an average over a period of years of 2 to 1 in ratio of net earnings to fixed charges for a railroad may be ample, a ratio of 3 to 1, or even 4 to 1, for an industrial, would not be excessive. A broad knowledge of the entire industry in which investment is contemplated is important. Is the particular company in a position to meet **any kind of competition** which may arise? Does its **success depend upon patents, secret processes, or other forms of monopoly** which may not be permanent, or has its record been made in a broad competitive field? Is it a so-called "**one-man concern,**" or is the organization such as to assure continued **good management** under any conditions? These are all questions which may be properly asked. If the bonds are secured upon mining and other property, the value of which will be depleted in regular conduct of the business, then a sinking fund should be provided to assure retirement of debt as assets disappear. In fact, the majority of industrial issues provide for retirement of a part or all of the bonds by maturity.

The wealth of information available regarding past and present conditions of utilities and railroads is a decided point in their favor, and if investors, before buying an industrial security, would demand assurance that such information would at all times be available, much loss might be saved. Some of our largest corporations, such as U. S. Steel and General Motors, publish detailed information concerning their current operations. The N. Y. Stock Exchange has done much to further the cause of intelligent publicity and the reports which the Exchange requires have done much to popularize "listed bonds" among investors.

FOREIGN DOLLAR BONDS.—These are the bonds of foreign governments, states, and municipalities issued in the United States, and payable, principal and interest, in dollars. The bonds of foreign industrial corporations are still so new in this country as hardly to warrant special treatment. The **obligations of foreign governments** also are still relatively new to American investors, but they have been issued in such large volume during and since the World War that their fundamental investment merits have received much study, and appreciation of them continues to grow. Borrowing by one country through the sale of bonds to investors in another country has been going on for a great many years, and European investors are thoroughly familiar with this type of security. The United States, however, prior to 1914 was a debtor nation. Many of our great railroads and other undertakings have been financed partly by foreign capital. America was a new country in the stages of development; interest rates were naturally high and attracted capital. International exchange rates ruled generally at or near their mint parity, so that factor was of relatively minor importance. The World War changed the situation entirely. A large share of the world's gold came to this country, and after the conflict, Europe in particular and the rest of the world in general had to have new capital to rehabilitate industrial life and protect and rebuild stable currency systems.

They naturally turned to this country, and made their loans attractive to American investors by paying high interest rates.

On the whole, these loans have tended to accomplish the results for which they were designed. Great strides have been made toward restoring the natural flow of capital and there are already (1925) some signs pointing toward the time when the old markets, such as London and Amsterdam, will again assume their dominant positions with respect to foreign financing. Unless American investors continue to study and fully appreciate these loans, they may be lost to us in the future.

Undoubtedly, there are many grades of foreign bonds. Statistics showing per capita wealth, per capita debt, exports and imports, revenues, and expenditures, are of value, but are often misleading when considered alone. For example, the bonds of France, which country has a tremendous national debt, and faces (early 1925) really serious financial difficulties, command a better market than do those of Brazil. The per capita debt of Brazil is almost negligible, as compared with that of France, but Brazil has on two occasions suspended certain parts of the service on her loans in London, while France has an unblemished record for promptly meeting all her obligations. International politics, as well as national politics, are important factors, as is also the element of racial prejudice. In fact, public credit depends so largely upon national character and reputation as to overshadow sometimes all other things. National character is one of the most lasting things in the world and once established may be the greatest financial asset of any government.

With respect to the safety of foreign securities, the following from Moody's "Analysis of Foreign Government Securities," is of interest:

"On the other hand, a defaulting government is by no means in so hopeless a position for the investor as a defaulting corporation. The financial history of governments clearly indicates the presumption that adjustment and settlement with the bondholders will eventually be made, almost irrespective of political changes. This sometimes takes years, but there has seldom been a frank repudiation of a bona fide obligation contracted by a government. The recent settlement of the Mexican debt question illustrates this. That state has been in default for more than a decade wherein governments have come and gone, but still it is meeting the claims of the bondholders.

"The Republic of Honduras furnishes another interesting example. After being in default for nearly half a century a settlement was recently brought about; and this has occurred notwithstanding that the bankers who advanced the credit to Honduras were probably more at fault than the government itself. Now we are witnessing advance indications that the time may not be very far off when even Russia will bring order into its financial house. Upon the whole, therefore, national governmental defaults are so small in comparison with the billions of dollars of public bonds issued as to amount to a compliment to the honor of governments and the quality of public securities."

MUNICIPAL BONDS.—These include the obligations of **states, counties, and other political subdivisions** of the United States. This group is recognized as ranking **next in safety to United States government bonds** and has always been widely purchased for safety. The income derived from such bonds is **exempt from all federal income taxes,** so that they are particularly attractive to individuals subject to heavy income surtaxes. The obligations of states and prominent cities are readily salable and are consequently purchased at times by conservative commercial banks. It seems doubtful, however, that the financial manager of an average-sized corporation will have much oc-

sion to invest in securities of such relatively low yield except at times in the very early maturities.

FEDERAL FARM LOAN BONDS.—These are issued by the federal land banks and the joint stock land banks, established under the Federal Farm Loan Act. They are secured by an equal amount of first mortgages on farm property or U. S. government bonds. The bonds are exempt from all federal, state, and local taxation, except estate and inheritance taxes. These banks have been conservatively and successfully operated and their bonds are regarded as high-grade investments. The chief difference between the two classes of farm loan bonds is that all of the 12 federal land banks are jointly liable for all federal land bonds issued, while the joint stock land bank bonds are the obligations only of the particular issuing bank.

INVESTMENT SERVICES.—Local banking connections can be of assistance in the purchase of commercial paper or prime bank acceptances, but such purchases do not require the exercise of much judgment. In the general task of selecting investment securities, inquiries and requests for advice put to the majority of medium-sized banks must necessarily be referred by them to the particular investment bankers in large cities with whom they are acquainted. If the question is referred to a metropolitan banking connection, it will usually be turned over to the bond department of the bank, or an investment banking organization affiliated with it. Occasionally it will be found that some individual connected with a medium-sized bank is really qualified to give counsel on the actual purchase of securitities, but more often than not, the advice requested will come indirectly from an investment banking house.

The term "investment banker" is not well defined as it may mean anything from the small bond dealer who employs the services of two or three salesmen to the large security underwriting and distributing firms who have offices in many cities and representatives covering large sections of the country. These larger organizations are in a position to supply latest available information and figures regarding any security, but they are heavily interested in the investment market for their own accounts, and advice will, at times, be naturally biased. The small dealer, on the other hand, may be in a position to express an unbiased opinion in some cases, but his facilities are not so far-reaching. It appears that the best investment counsel available without cost, therefore, is that of a large investment house of established and conservative reputation. It is to the credit of such firms that, as a rule, they do give sound advice.

The **independent investment agencies** which do not buy or sell securities but make a charge for their services are, as a rule, very reliable. The largest and best known of these agencies are Moody's Investors Service, New York City; Standard Statistics Co., New York City; and Poor's Publishing Co., New York City. They publish manuals of investment information and rate securities. The ratings are valuable helps to anyone endeavoring to ascertain the investment position of a security and they are generally conservative, so that while an investor who limits purchases to issues of the higher ratings may miss some attractive opportunities, it is also true that he will seldom, if ever, get an unsound security. These three companies also maintain correspondence services. Another widely used investment publication is the "Fitch Bond Book," published by the Fitch Publishing Co., New York City. It also now carries ratings on bond issues.

INVESTMENT SECURITY MARKET.—This market is composed of a great many parts, each of which has an important relation to the whole. At

the head of the list are the strictly **underwriting firms** which sell almost entirely on a wholesale basis to the great body of investment bankers and dealers. In this class, J. P. Morgan & Co., and Kuhn, Loeb & Co., both of New York City, are the leaders. Next to them come a large number of investment banking houses and the bond departments of some metropolitan banks which carry on an underwriting and wholesaling business in addition to retailing direct to investors through their sales representatives. After that group in the list come the hundreds of **small security dealers** and bond departments of banks which retail only. All of these firms are in business for financial gain, and always stand ready to buy any securities which are found to meet their investment requirements and which they anticipate being able to sell to their clients at a price which allows a fair margin of profit. It is because of this fact that securities generally find their proper market level. Hundreds of dealers are constantly searching the markets for bargains while others are at the same time ready to recommend that their clients dispose of any securities that appear to be selling too high.

The market, as a whole, is thus always kept in action, and very few genuinely attractive investment opportunities are neglected for any length of time.

When a large issue of bonds or stock is to be sold, it is customary for the negotiators of the business to form an **underwriting syndicate** which may include anywhere from 2 to 20 prominent investment banking firms, or possibly more. The syndicate assumes the risk of being able to market the securities for an aggregate sum, which will show a profit over the price guaranteed to the issuing company, government, or municipality, as the case may be. The next step is the public offering at a definite price, fixed by the syndicate managers, in which a large number of dealers are invited to participate at a price allowing the syndicate members a small profit and low enough to permit the dealer to sell at the set price with a profit for himself. The amount of profit varies considerably. An average in many cases might be a gross profit of $35 per $1,000 bond, out of which the dealers are allowed to make a profit of $25 per $1,000. The syndicate agreement is frequently binding for a period of 60 days, and imposes a penalty upon any participant who offers the securities below the set price, prior to the dissolution of the syndicate. This agreement assures the maintenance of the original price during the period of distribution to the actual investors.

It will be seen that the announcement "All bonds of this issue have been sold" does not necessarily mean that they have been purchased by investors. A well managed syndicate makes every effort to accomplish thorough distribution and a strong market. Sometimes they are successful, and at other times, the termination of a syndicate will be the signal for heavy selling in the open market and consequent drop in price. At such times, syndicate members may suffer severe losses. It is difficult, at times, to judge the proper price at which a new issue will be well taken, and this fact points to the importance of inquiring about performance on past offerings of the sponsors for any security issue.

Investment securities have a strong tendency to seek their proper market levels so that the offer of an unusually high return should be an invitation for thorough examination. Following this should be noted the fact that any sound business situation tends to improve while a questionable situation tends in the other direction, because a company whose credit position permits it to borrow at 5% has more chance of success, all other things being equal, than one which is forced to pay 8% for its borrowed capital.

SECTION 29

BUSINESS STATISTICS

PURPOSE OF BUSINESS STATISTICS.—Statistics are facts expressed numerically. Statistics are useful in a business to the extent that they enable the executives to control expenses, promote greater efficiency and augment profits. This section deals with the forms of statistics which successful executives have found helpful to themselves and their organizations. Consideration of these forms is important because comprehension of facts is affected quite as much by the method of presentation as by the accuracy of the data.

CLASSES OF STATISTICS USED WITHIN AN ORGANIZATION.—James H. Bliss, in "Financial and Operating Ratios in Management," classifies statistics used within business organizations into three general classes:

1. **Statistics on a business** for use in directing and controlling its operations and financial affairs.
2. **Statistics on the industry,** for developing competitive standards in that line of business to which earnings and expense ratios, turnovers, and other statistics of the individual company may be compared, thus indicating the status of the individual company in relation to its competitive standards.
3. **Statistics on the affairs of customers** to whom credit is extended, as the company is vitally interested in the affairs of its customers who, in the aggregate, represent its outlet for products.

STATISTICS ON THE INDUSTRY.—In addition to statistics on an individual business, provision should be made for accumulating all available statistics on the affairs of the particular industry. By comparing the showing of the individual company to these **standards or averages,** most valuable and useful information may be obtained. In most lines of business, quite usable statistics on the affairs of the industry may be developed from published financial statements and reports received from commercial agencies or other available data. Most business men are much interested in the results shown by competitors and naturally compare their own accomplishments with those of others. What they need is an analysis of the reasons why their showing may compare favorably or unfavorably with that of other businesses. The more complete the information available on the affairs of other concerns, the better and more useful the analysis which may be made. But even with incomplete reports, valuable information may be developed by comparisons with the statistics of one's own company.

A business has in its income statement a fair measure of the most important competitive standard—the **margin of gross earnings on sales.** This should be considered in connection with the spread in prices for materials and products existing from time to time. It is out of this gross margin that all costs, expenses, and profits must come. If the business has realized a satisfactory and com-

petitive margin of gross profit and still shows poorer final results than others, it has failed to meet competitive standards in some other phase of its affairs, either in overhead costs in production or distribution, in turnovers, or in efficiency in financial affairs. Any fragmentary information on competitive standards which may be available might be quite valuable when considered in connection with these conditions. The preparation and analysis of such statistics is best accomplished within the organization by those who are in intimate touch with the affairs of the business and can best judge its competitive conditions.

STATISTICS ON CUSTOMERS' AFFAIRS.—Statistics on the affairs of customers are useful, both in judging the lines of credit to be extended and in maintaining contact with the trend of **business conditions affecting the trade.** Any company is necessarily much interested in the affairs of its customers who in the aggregate represent its outlet for products. Business conditions and other circumstances affecting the affairs of customers are reflected in the sales and collections and mean better or poorer outlets for products.

Extending credit to a customer is lending capital to him on which to do business. The analysis of financial statements of customers affords the means of judging the financial position of the customer and gives an insight into the business and the efficiency of its management. In a sense the viewpoint of a credit man in an industrial organization is quite similar to that of the banker. The files on each important line of credit advanced might advantageously provide for carrying **continuous analysis of the statements** of the customer. In addition, where substantial lines of credit are advanced to several competing businesses, the accumulation and analysis of statistics on these as a group should afford valuable information to be kept in mind in judging any similar individual line of credit.

Statistical Classification and Tabulation

BASIS OF TABULATION.—Tabulation is based on **classification,** which is the basis of orderly thinking and consists in arranging statistical data into groups according to the character of the data. After classification, tabulation consists in arranging data thus classified in form of tables, which possess the advantages which classified data possess over unclassified data. These may be summarized as regularity, comparability, compactness, and legibility.

Certain conditions control method and arrangement in tabulation. One factor, frequently, is time, in which case the arrangement is **chronological.** Other arrangements are based on geographical location, magnitude, and the alphabet. **Arrangement** must always be considered as a function of purpose and should be varied when the purpose changes if a more effective presentation can be secured. Material should not be allowed to take tabular form without first being subjected to careful examination to determine the relationship of the different parts.

TECHNIQUE OF TABULATION.—The technique of tabular forms is a function of the information to be presented. It may be desirable to present one or more facts regarding a given class of data, and ordinarily the number of facts to be presented determines the construction of the table. The form to be adopted is the one which best brings out the relationships which it is desired to emphasize. In addition, certain other considerations of general character must be allowed for. One is the **physical limitation of the printed page.** An arrangement which crowds either dimension of the page should be avoided. Where

totals are to be shown, their position must be carefully considered. Until recently it has been customary to show these at the bottom of the page, but it has now become the frequent practice to show them at the top as in the table shown in Fig. 1. This places the totals in the most conspicuous position, which is their proper place if it is desired to emphasize them. Great care should be exercised in formulating the **titles of statistical tables.** While they should be brief, they should state clearly what the contents are. Improperly worded and arranged titles are a frequent cause of failure in presenting useful data.

FIG. 1. Table Showing Totals at Top

The **nature of the data** to be tabulated must be taken into consideration in determining the form of table to employ. In case of **historical data** time is a controlling consideration and must dominate the arrangement. Where data give a **cross-sectional view as at a given time,** the factor of time may be ignored except in the title. In preceding illustration time is a controlling factor. In Fig. 2, showing the range of prices of certain stocks on the New York Stock Exchange, time is not a controlling factor in determining tabular arrangement. Here alphabetical arrangement controls horizontally, while order of sales controls vertically. In a sense, time is a factor, since the "open" price occurs first and the "close" price last, but this is not true of the "high" and "low" prices.

Open, High, Low, and Closing Prices of Eight Stocks on the New York Stock Exchange on September 2, 1925

Name of Stock	Open	High	Low	Close

Wabash.....	42½	43¼	41¼	41¾

FIG. 2. Table Showing Arrangement in Which Time is not a Controlling Factor

Another type of data is that which expresses **variations at a single point in time.** This kind of data is usually formed into groups of equal width. It is illustrated in **Fig. 4.**

AVERAGES—THEIR FUNCTION.—To interpret large masses of data it is necessary to secure certain **brief summaries** which, while not presenting all the information which may be secured from the original data, do bring out the **fundamental tendencies** which underlie it and which a casual inspection of the data does not ordinarily make evident. The purpose of averages is to interpret the tendencies hidden under great masses of figures. In making this interpretation details must be neglected, because it is the essential purpose of averages to avoid details. The process of finding and using averages is a process of interpretation.

LIMITATION OF AVERAGES.—In employing averages as short-cuts to an understanding of statistical data, care must be used not to make a wrong interpretation. Purely mechanical construction of averages unaided by judgment and the process of elimination of material which serves to obscure real tendencies is apt to lead to erroneous results. Averages are **frequently fictitious,** in that they may not be representative of any actual existing thing. They are representative of types which do not necessarily have actually existing counterparts. Such generalized expressions necessarily possess limitations as to usefulness. Sometimes their employment indicates neglect or a willingness to forego a more searching inquiry. They must be used with judgment and caution. On the other hand, where detail may be neglected, averages oftentimes give an accurate picture of tendencies.

ARITHMETIC AVERAGES.—The arithmetic average is the average most widely used. It is described as being the **center of gravity of a statistical series.** To secure it all items in a given series must be considered. It is a mathematical concept and may have no actually existing counterpart. The average of two entirely different series may be the same. The average of 7, 6, 5, 3, 2, 1, is 4. The average of 1, 3, 8, is also 4. The arithmetic average ignores the character of the distribution within the series. It should be **used with great care** because it is of a highly abstract character. In the **absence of bias,** i.e., where the members of a series are determined by chance, the arithmetic mean approximates more nearly the true value as the number of members or items in the series is increased. Series of this type are infrequent in economics and business because data on wages, sales, purchases, and so on are not determined purely by chance.

The arithmetic average is secured by totaling the items in a series and dividing their sum by the number of items, as shown in Fig. 3.

The **simple arithmetic average,** however, is frequently unsatisfactory as a summary figure. If the group is not homogeneous, if the extremes are far apart and the distribution between the extremes uneven, the arithmetic average may not be identical with or even representative of any of the constituent parts of the group. The average may fall at a point that does not correspond exactly with any items in the group. A few items at either extreme of a non-homogeneous group that covers a wide range may exercise a distorting influence upon the arithmetic average, and under some circumstances the arithmetic average may fail to show changes within a large group.

As an example, the average wage for the employees of a factory, over a period of time, may remain stationary while conditions undergo a material change. A small number of highly paid employees may receive an increase in wages while the wages of a larger number of less highly paid men are reduced, the changes just balancing themselves in the average. The average wage may be lowered in another instance merely because of the employment of a larger number of low-paid workmen, without any change in the rates of remuneration

Prices of Suits, Number of Each Sold in a Given Period, and Products of Prices and Numbers

Prices Suits	Number of Each Suit Sold	Products of Prices and Numbers
Total	422	$11,993
$15.00	47	$ 705
16.50	36	594
18.00	53	954
22.50	80	1,800
30.00	60	1,800
33.00	30	990
36.00	25	900
45.00	60	2,700
50.00	31	1,550

Average price per suit = $11,993 ÷ 422 = $28.42

FIG. 3. Table Showing Method of Calculating Arithmetic Average

for any class of labor. Consequently, the average wage is a worthless figure whenever the group for which it is computed includes different classes of labor with varying rates of remuneration; it throws light neither upon labor cost nor upon the welfare of the laborers. Numerous other averages must be similarly qualified. It is in such cases as the preceding that a classification of the data is especially essential if comparisons are to be made.

The importance of items in a series is sometimes affected by the frequency with which they occur. When each item occurs but once, the **question of weighting** does not arise, because due allowance is made for each occurrence when the average is found according to the rule stated above. When the

Wage Groups, Frequencies in Each Group, and Data for Determination of the Arithmetic Average

(1) Wage Groups	(2) Frequencies in Each Wage Group	(3) Products of Frequencies and Middle Terms of Each Group
Total	359	$2,512.50
$ 2.00 to $ 2.99	12	$ 30.00
3.00 " 3.99	15	52.50
4.00 " 4.99	30	135.00
5.00 " 5.99	70	385.00
6.00 " 6.99	65	422.50
7.00 " 7.99	58	435.00
8.00 " 8.99	41	348.50
9.00 " 9.99	30	285.00
10.00 " 10.99	22	231.00
11.00 " 11.99	12	138.00
12.00 " 12.99	4	50.00

FIG. 4. Table Showing Series Consisting of Frequency Groups

various items of a series have various frequencies, it is necessary to take thes frequencies into account in securing a true or weighted average.

FREQUENCY GROUPS.—In the case of statistical series consisting o frequency groups the number of items falling within the limits of each grou is given but the arrangement within the group is not known. It is, therefor necessary to assume an even distribution within the group and to multipl the frequencies by the middle terms of each group. The procedure is illustrate in Fig. 4. The arithmetic mean is secured by dividing the sum of column (3 by the sum of column (2), the group frequencies. In this case we have

$$A.\ M. = \$2{,}512.50 \div 359$$
$$= \$7.00$$

THE COMMON DENOMINATOR.—The common denominator is a form of weighted average designed to indicate the general movement of sever classes of units without reference to an individual unit. The basis of conversio to be used in arriving at any common denominator varies in different industrie It may be selling price, labor or material cost, or a combination of several them. An example of the use of a common denominator is presented in th case of a corporation producing several classes of storage batteries. For st tistical purposes the Edison Storage Battery Co. sometimes converts all typ of batteries sold or produced to a unit basis of one battery known as an "A equivalent." While the following figures are not the ones used, they serve t indicate the principle as shown in Fig. 5:

The A-4 = 1 unit
The B-4 = 2 units
The A-6 = 1.5 units

Storage Batteries Production

Types of Cells (1)	Number of Cells Produced (2)	Factor Multiplier or Unitary Value (3)	Number of Units Produced (4)
A-4	1,000	1	1,000
B-4	1,000	2	2,000
A-6	1,000	1.5	1,500
			4,500 A-4 equivalents

FIG. 5. Table Illustrating Use of Common Denominator

Thus, the production was 4,500 A-4 equivalents where the A-4 is the comm denominator.

Another use of a common denominator is exemplified, in the case of railroa by the unit known as "dollars per train mile," which is obtained by dividi the total dollars received or expended for operation by the total number miles run by the trains during a given period.

BUSINESS STATISTICS ORDINARILY AVAILABLE.—Business statist may be grouped into two general classes:

1. External statistics, which indicate the general trend of business a market conditions.
2. Internal statistics, which are concerned with the operations of an in vidual business enterprise.

External Statistics.—"Examples of this class are the statistics of manufactures, agriculture, population, etc., collected by the United States Bureau of the Census; railroad or other public utility statistics published by the Interstate Commerce Commission and by state commissions; banking and financial statistics published in the financial journals; price and production statistics published in trade papers, and the reports of trade associations." ("Business Statistics," by Melvin T. Copeland.)

Internal Statistics.—Internal statistics comprise those obtained from the accounts and records of an individual business and may cover any details of the business including sales and advertising data, factory costs and expenses, etc. "Such reports and records are used in business establishments of all sorts, both large and small. In fact successful business administration depends to a large degree upon these reports and records, which are utilized for checking up current operations and determining tendencies. They provide a basis for the formulation of plans and policies. If all of the details of the business are to be followed accurately and if exact standards are to be established for comparison, such records are indispensable.

"In some large manufacturing companies an elaborate statistical system is maintained, whereby the various department heads obtain statistical reports for their own guidance and summaries of these departmental reports are prepared at regular intervals for the chief executive. By this means statistics are gathered

Monthly Record of Sales by Departments

Months	Dept. 1	Dept. 2	Dept. 3	Dept. 4	Dept. 5	Total

from all corners of the organization, covering all of its activities. These current reports are supplemented by reports on special tests or investigations. The use of statistics is not confined, however, to large companies; many small manufacturing establishments and numerous retail stores of ordinary volume of business utilize statistical records to advantage." ("Business Statistics," by Melvin T. Copeland.)

FORMS OF STATISTICAL RECORD.—Simple forms of statistical records are shown in Figs. 6–9.

FIG. 9. Example of Statistical Record

The Business Cycle

DEFINITION.—A cycle is a round of operations or events—a series which returns upon itself. The term "business cycle" is based on the premise that there is a sequence in business events which repeats itself at certain intervals

of time. The steps in this sequence are variously defined. Jordan[1] defines them as prosperity, liquidation, depression, recovery; Copeland[2] defines them as prosperity, crisis and depression; the Harvard Economic Service calls them depression, recovery, business prosperity, financial strain and industrial crisis. For discussion of the economic theories of business cycles, see Section 1 on the Fundamentals of Business Economics.

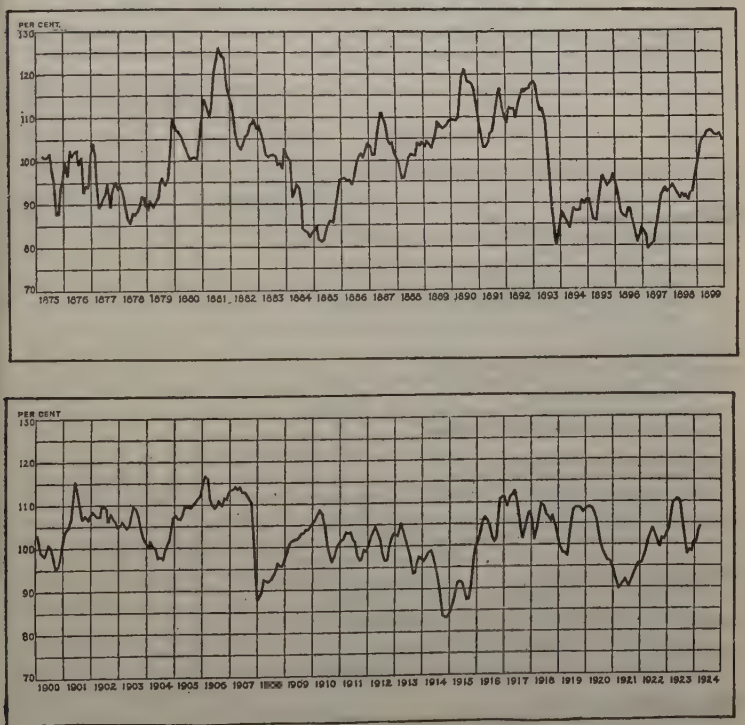

FIG. 10. Fluctuations in Business for 25 Years—the line showing bank clearings corrected for price variations

CAUSES UNDERLYING THE BUSINESS CYCLE.—Herbert Hoover in a statement before the President's conference on unemployment in Washington, in September 1921, said:

"Broadly, the business cycle is a constant recurrence of irregularly separate booms and slumps. The slumps are in the main due to the wastes, extravagance, speculation, inflation, over-expansion and inefficiency in production

[1] "Business Forecasting," by David F. Jordan.
[2] "Business Statistics," by Melvin T. Copeland.

developed during the booms. The strategic point of attack is the reduction of these evils, mainly through the provision for such **current economic information** as will show the signs of danger, and its more general understanding and use by producers, distributors and banks, inducing more constructive and safer policies."

The "booms and slumps" referred to by Mr. Hoover are portrayed in the chart in Fig. 10, taken from the monthly review of the Federal Reserve Bank of New York. Bank clearings are used as the basis for the charts.

The **Harvard Economic Service** presents its conception of the business cycle, with specific reference to the period from 1903 to 1914, as shown in Fig. 11.

Phase	Nov.–Dec. 1903 to Nov.–Dec. 1907	Jan.–Feb. 1908 to July–Aug. 1910	Sept.–Oct. 1910 to Nov.–Dec. 1913
	Months	Months	Months
Phase 1: Depression (a) Security prices begin to advance; speculative activity increases. (b) Commodity prices continue to decline; business activity is sluggish. (c) Rates on commercial paper decline; bank reserves increase.	10	6	10
Phase 2: Recovery (a) Speculative activity is marked. (b) Business activity recovers; commodity prices begin to advance. (c) Rates on commercial paper begin to advance late in this phase of the cycle.	18	14	12
Phase 3: Business Prosperity (a) Speculative activity is checked. (b) Business activity and commodity prices continue to increase. (c) Rates on commercial paper continue to advance while bank reserves decrease.	10	4	8
Phase 4: Financial Strain (a) Security prices decline sharply; speculative activity is depressed. (b) The upward tendency of business activity and commodity prices is checked. (c) Rates on commercial paper remain high or stiffen and the banking situation is strained.	10	4	4
Phase 5: Industrial Crisis (a) Prices of securities reach bottom and speculative markets are panicky. (b) Commodities are liquidated, prices fall, and business activity slumps badly. (c) Rates on commercial paper reach maximum and bank reserves reach minimum. The crisis breaks.	2	4	6
Length of complete cycle	50	32	40

Fig. 11. Harvard Economic Service Conception of Business Cycle Phases

STATISTICS AS BAROMETERS OF BUSINESS.—Many business men now endeavor to secure themselves against the effects of depression and panic by the use of statistical information which will aid in forecasting the probable

length of each phase of the business cycle and in making preparations to meet changing conditions. Such statistics are looked upon as **business barometers,** their purpose being to indicate as reliably as possible the conditions which are likely to be encountered next in the business world. Statistics concerning activities which respond most readily to changing economic conditions are most effective as barometers, some of the most useful being as follows:

- Business failures
- Bank clearings
- Commodity prices
- Imports and exports
- Corporation earnings
- Crop conditions
- Wages of labor
- Idle freight cars
- Gold production
- Iron and steel production
- New buildings

Index Numbers

PURPOSE.—Index numbers, in the form usually of averages, are employed to show **trends in prices** or in other movements which can be quantitatively expressed by means of statistical data. Usually these averages are averages of relative numbers, although it is not uncommon to employ sums of actual prices as index numbers.

NATURE OF COMMONLY QUOTED INDEX NUMBERS.—Melvin T. Copeland, in "Business Statistics," makes the following observations:

"Few of the widely-used index numbers are made to serve one special purpose. On the contrary, most of them are **'general-purpose' series,** designed with no aim more definite than that of measuring changes in the price level. Once published they are used for many ends—to show the depreciation of gold, the rise in the cost of living, the alternations of business prosperity and depression, and the allowance to be made for changed prices in comparing estimates of national wealth or private income at different times.

"The **reliability of an index number** obviously depends upon the judgment and the accuracy with which the original price quotations were collected. This **field work** is not only fundamental, it is also laborious, expensive, and perplexing beyond any other part of the whole investigation. Those who deal with data already published are prone to regard all this preliminary work as a clerical compilation requiring much industry but little skill. To judge from the literature about index numbers one would think that the difficult and important problems concern methods of weighting and averaging. But those who are practically concerned with the whole process of making an index number from start to finish, rate this office work lightly in comparison with the field work of getting the original data.

"Wholesale prices of articles like pig iron, cotton, or beef, are commonly spoken of as if there were only one unambiguous price for any one thing on a given day. However, this price may vary from one day to another. In fact, there are **many different prices** for every great staple on every day it is dealt in, and most of these differences are of the sort that tend to maintain themselves even when markets are highly organized and competition is keen. It is still more difficult to secure satisfactory statistics concerning the **relative importance of the various commodities** quoted. What is wanted is an accurate census of the quantities of the important staples, at least, that are annually produced, exchanged or consumed. To take such a census is altogether beyond the power of private investigators or even of the Government bureaus now engaged in making index numbers.

"American index numbers are made from market prices, usually obtained

directly from manufacturers, selling agents or wholesale merchants, from record of produce exchanges, or from trade journals and newspapers which make specialty of market reporting. Several important **foreign index numbers** ar made from 'import and export values,' that is from average prices of importan articles officially declared.

"A **food index number** is likely at any time to give a wrong impression re garding the shifting of prices in general, and is especially treacherous as business barometer. Nor can such an index when made from wholesale price be trusted to show changes in the 'cost of living'; for living expenses are mad up of retail prices, and fluctuations in retail prices do not follow closely thos in the wholesale markets.

"If **rational weighting** is worth striving after, then by what criterion sha the relative importance of the different commodities be judged? That depend upon the object of the investigation. If, for example, the aim be to measur changes in the cost of living, and the data be retail quotations of consumer commodities, then the proportionate expenditures upon the different article as represented by collections of family budgets should be given appropriat weights. If the aim be to study changes in the incomes of farmers, then th data should be 'farm prices,' and the list of commodities should be limited t farm products, and the weights should be proportionate to the monetary receipt from the several products. If the aim be to construct a business barometer the data should be prices from the most representative wholesale markets, an the list should be confined to commodities whose prices are most sensitive t changes in business prospects."

STEPS IN CONSTRUCTION OF INDEX NUMBERS.—Professor W. C Mitchell enumerates the steps involved in the construction of index number as follows:

"(1) Defining the purpose for which the final results are to be used; (2 deciding the numbers and kinds of commodities to be included; (3) determinin whether these commodities shall be treated alike or whether they shall b weighted according to their relative importance; (4) collecting the actual price of the commodities chosen, and, in case a weighted series is to be made, collectin also data regarding their relative importance; (5) deciding whether to measur the average variations of prices or the variations of a sum of actual prices; (6 in case average variations are to be measured, choosing the base upon whic relative prices shall be computed; and (7) settling upon the form of average t be struck.

"At each one of these successive steps choice must be made among alternative that range in number from two to thousands. The possible combinations amon the alternatives chosen are indefinitely numerous. Hence there is no assignab limit to the possible varieties of index numbers, and in practice no two of th known series are exactly alike in construction. To canvass even the importan variations of method actually in use is not a simple task."

Use great care in the selection and use of data for purposes of index numbe making. There is never a single price for a commodity, because prices var as between wholesale and retail, locality, and so on. The data used must b truly representative. If selection is necessary because of the impossibility including all data, use care to see that it is representative. Regarding th choice of commodities and the importance assigned to each, Professor Mitche says:

"As for the small series made from the prices of foods alone or from the price of any single group of commodities, it is clear that, however good for speci uses they may be, they are untrustworthy as general-purpose index number

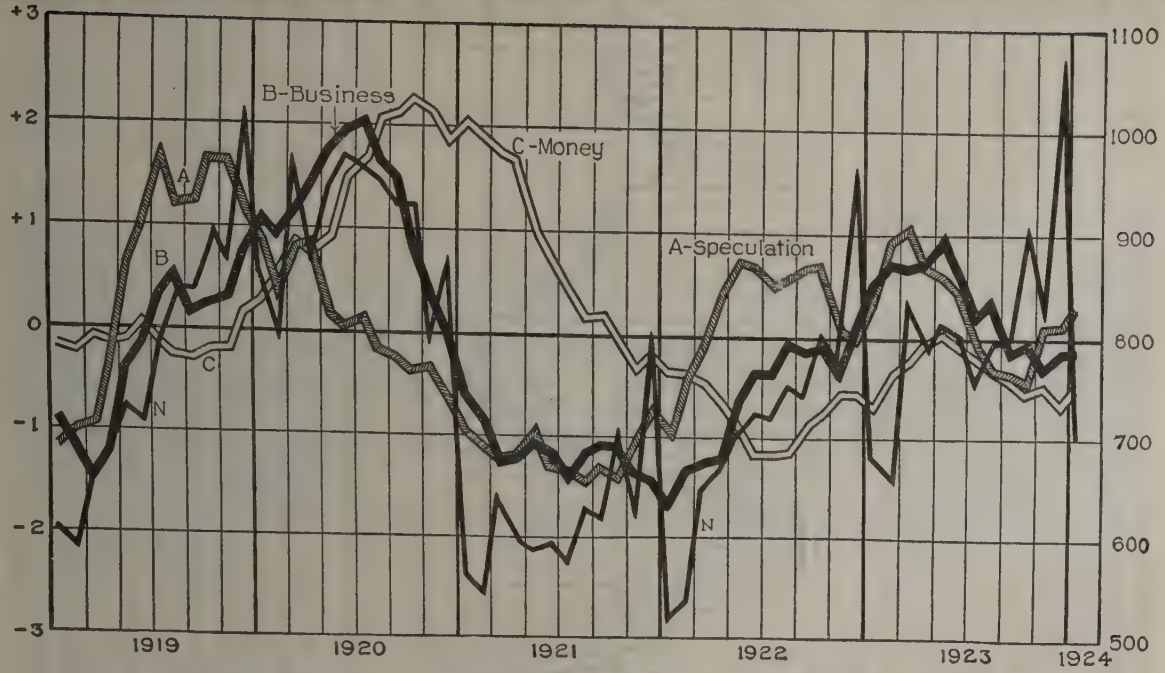

FIG. 12. Sales of Company N (Actual Data in Hundreds of Dollars) Compared with the Harvard Index Curves

"The second conclusion . . . . is that large index numbers are more trustworthy for general purposes than small ones, not only in so far as they include more groups of related prices, but also in so far as they contain more numerous samples from each group. What is characteristic in the behavior of the prices of farm crops, of mineral products, of manufactured wares, of consumers' goods, etc.—what is characteristic in the behavior of any group of prices—is more likely to be brought out and to exercise its due effects upon the final results when the group is represented by 10 or 20 sets of quotations than when it is represented by only one or two sets. The basis of this contention is simple: In every group that has been studied there are certain commodities whose prices seldom behave in the typical way, and no commodities whose prices can be trusted always to behave typically. Consequently, no care to include commodities belonging to all the important groups can guarantee accurate results, unless care is also taken to get numerous representatives of each group."

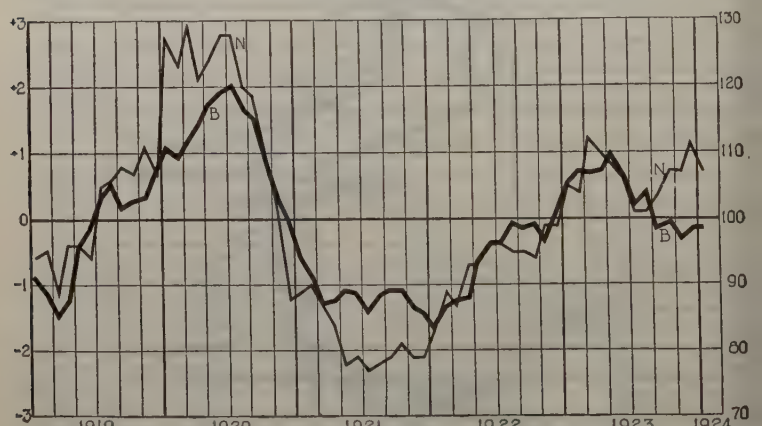

FIG. 13. Sales of Company N (Per Cent Relatives to the 1919–21 Average as Base, Corrected for Seasonal Variation), Compared with the Harvard B Curve

USE OF INDEX NUMBERS OF GENERAL BUSINESS FOR COMPARISON WITH INDIVIDUAL BUSINESS.—Of particular interest to the business man is another type of index number, constructed by **combining into a single index several series** reflecting general business activity. (For a more detailed discussion of such index numbers, see the section on the Fundamentals of Business Economics.) A comparison of such general business index numbers with the records of an individual business house will often yield valuable information to the business man. The following extract from the Harvard Economic Service Bulletin indicates the procedure:

"In making a comparison between the fluctuations in a particular business concern and the Index of General Business [index of the Harvard Service], it is desirable to examine **several phases of the individual business,** as reflected by different series of statistical data. For instance, separate analyses may be made of production, stocks, shipments, orders entered, sales billed, prices of

FIG. 14. Walworth Manufacturing Company Sales Compared with Harvard Curve B (Business), 1903–1914

materials, pay-roll, gross income, net earnings. In fact, any statistical series which pertains to the business and for which a continuous monthly record extending over several years is available may yield interesting and useful results upon analysis.

"The fluctuations in some of these special series, however, are likely to be much more complex than in others. One series can generally be selected as giving the best single picture of the progress and condition of a particular business. It is understood, of course, that this most representative series may consist of one record of figures in one business and be based upon an entirely different phase of the records of another business: one business may find sales billed best, and another may select orders entered."

To illustrate this sales billed was selected as representative of the business organization. The chief reasons for this selection were that sales billed seem to be the figures most commonly available on a monthly basis for those who wish to make comparative studies; and, in such individual studies sales billed usually gave better results than the other series examined. The chart reproduced in Fig. 12 contains a line marked "N." This line represents actual sales in dollars. A refinement of the sales line may be made by **correcting it for seasonal variation.** A formula for doing this has been worked out in detail by the Harvard Economic Service. The sales for Company "N" as adjusted for seasonal variation are reproduced in Fig. 13 for comparison.

The Harvard Economic Service further states: "A number of subscribers have already determined the relation of their business to the economic cycle (curve B), and have found the results exceedingly valuable. The chart [shown in Fig. 14] presents a comparison of the monthly sales of the Walworth Manufacturing Co. with the Harvard curve B for the period 1903–14. It will be seen that there is a very close correspondence between the movements of the two curves throughout the entire period. Moreover this relationship has continued to obtain since the close of the war. A large number of subscribers undoubtedly would discover through investigation that the activity of their business corresponds approximately with the movements of the Harvard B line, although there are some who would find that their business precedes or lags behind curve B by varying intervals."

Graphic Presentation—Forms and Diagrams

ADVANTAGES OF GRAPHIC PRESENTATION OVER TABULATION.—Charts depend upon their **appeal to the eye** for their effectiveness. Stephen Gilman, in "Graphic Charts for the Business Man," says:

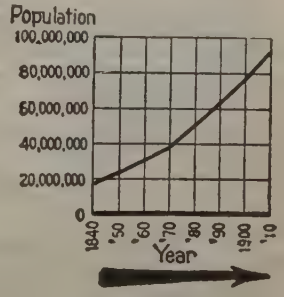
"The remarkable success of the moving picture industry has one important lesson for the American business man. It has convinced him as nothing else could, that the most effective appeal to the public is through the eye—not by print, but by pictures. This same peculiarity of human nature has been taken advantage of by the skilled advertising man. The magazine advertisement without the illustration is almost so rare as to excite comment. The reason is obvious. A picture is universal in its appeal. It can be understood by the American or the Chinaman, by the Spaniard or the Hindoo without difficulty. Printed words, sentences, and paragraphs, on the other hand, are distinctly limited in their appeal. The reader must get the author's meaning through a secondary medium, and not direct, as in the case of a picture. The engineering profession has for many years recognized this trick of human psychology. Engineers use pictures to convey engineering facts. The kind of pictures which they use are termed 'graphs' or 'graphic' charts."

Graphs are merely **pictures of figures.** Their function is to present to the mind in a definite, clear, and comprehensive manner, the relation of important factors to one another.

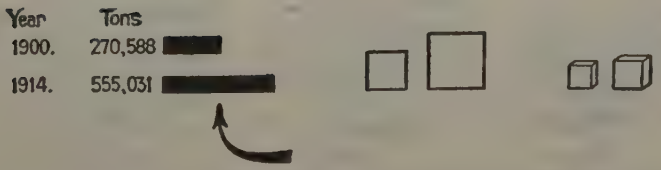
Long rows of figures must be thoroughly studied in order to convert them mentally into quantities which may be compared as to size. This is a tedious task which many executives have learned to dread. The reason is a simple one—a row of figures does not tell a story of itself. A somewhat involved mental process is required to grasp fully the real facts. The use of graphic charts or "curves," as they are sometimes called, permits more rapid and accurate interpretation of data. Many pages of valuable figures might be laboriously prepared; yet they have little value unless studied as an aid to administrative guidance. A simple chart may convey information more clearly than the most elaborately written report.

STANDARDS FOR GRAPHIC PRESENTATION.—The need for uniform standard for graphic presentation has been recognized by a number of organizations. Invitations were extended by the American Society of Mechanical Engineers to a number of associations of national scope and their efforts to standardize procedure have resulted in the appointment of a **Joint Committee on Standards for Graphic Presentation** which has issued a report containing the following suggestions as representing the more generally applicable principles of elementary graphic presentation:

1. The general arrangement of a diagram should proceed from left to right.

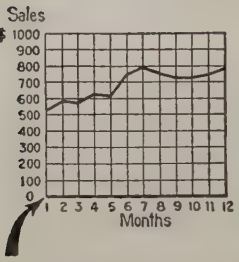


(1)



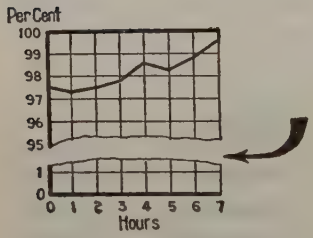
(2)

2. Where possible represent quantities by linear magnitudes, as areas or volumes are more likely to be misinterpreted.



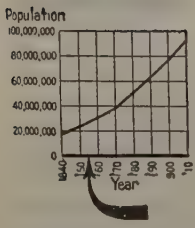
(3)

3. For a curve the vertical scale, whenever practicable, should be so selected that the zero line will appear on the diagram.

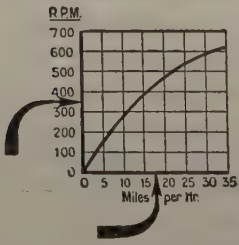


(4)

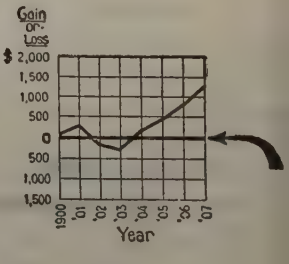
4. If the zero line of the vertical scale will not normally appear on the curve diagram, the zero line should be shown by the use of a horizontal break in the diagram.



(5a)

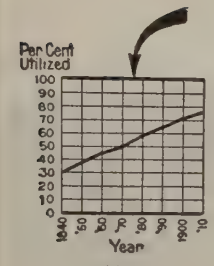


(5b)

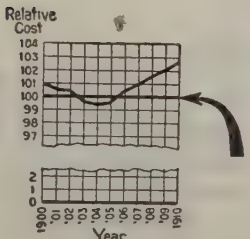


(5c)

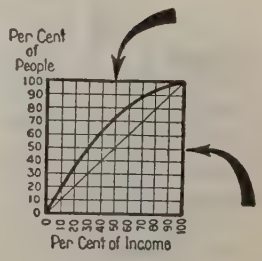
5. The zero lines of the scales for a curve should be sharply distinguished from the other coördinate lines.



(6a)

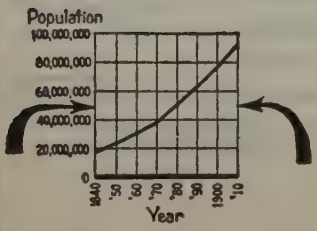


(6b)



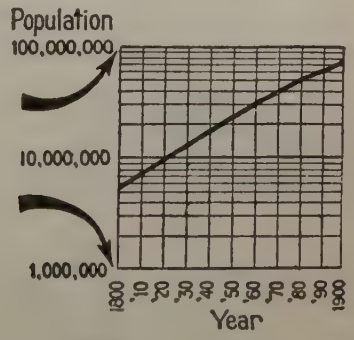
(6c)

6. For curves having a scale representing percentages, it is usually desirable to emphasize in some distinctive way the 100 per cent line or other line used as a basis of comparison.



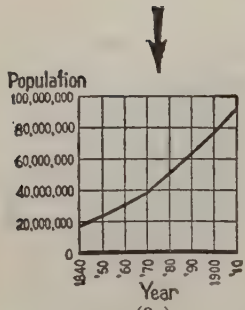
(7)

7. When the scale of a diagram refers to dates, and the period represented is not a complete unit, it is better not to emphasize the first and last ordinates since such a diagram does not represent the beginning or end of time.

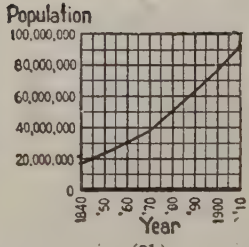


(8)

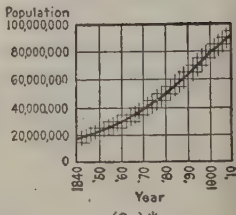
8. When curves are drawn on logarithmic coördinates, the limiting lines of the diagram should each be at some power of ten on the logarithmic scales.



(9a)



(9b)

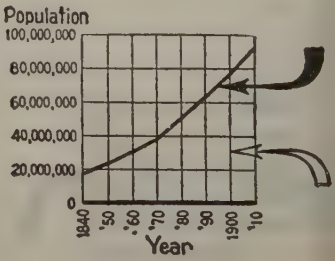


(9c)*

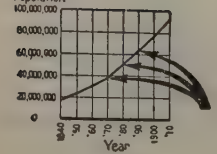
9. It is advisable not to show any more coördinate lines than necessary to guide the eye in reading the diagram.

*Figure 9c is not in the original report, but is offered here as another means of making the field clear by showing detail coördinates only in the zone of the curve.

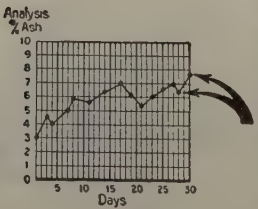
10. The curve lines of a diagram should be sharply distinguished from the ruling.



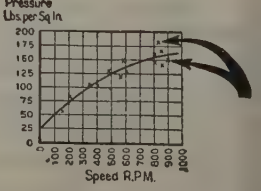
(10)



(11a)



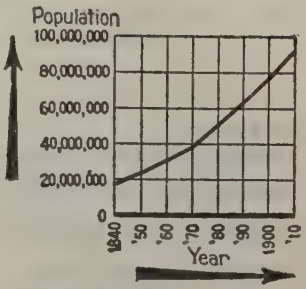
(11b)



(11c)

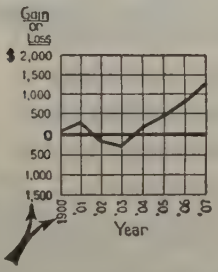
11. In curves representing a series of observations, it is advisable, whenever possible, to indicate clearly on the diagram all the points representing the separate observations.

12. The horizontal scale for curves should usually read from left to right and the vertical scale from bottom to top.

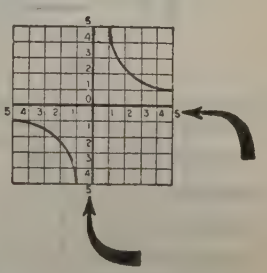


(12)

(13a)

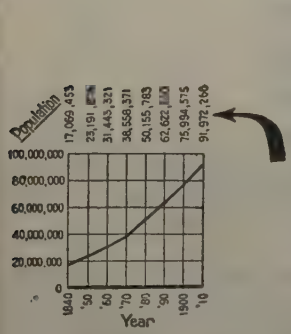


(13b)

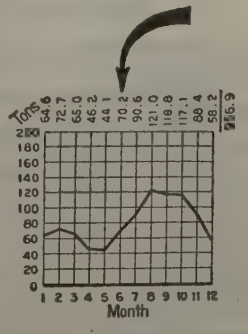


(13c)

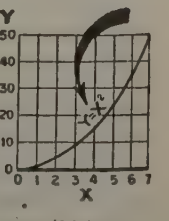
13. Figures for the scales of a diagram should be placed at the left and at the bottom or along the respective axes.



(14a)

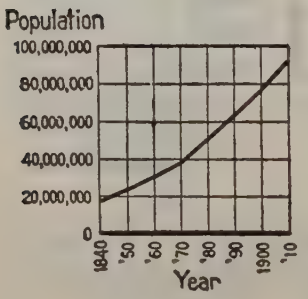


(14b)



(14c)

14. It is often desirable to include in the diagram the numerical data or formulæ represented.

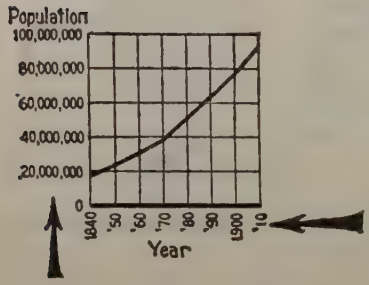


(15b)

Year	Population
1840	17,069,453
1850	23,191 876
1860	31,443,321
1870	38,558,371
1880	50,155,783
1890	62,622,250
1900	75,994,575
1910	91,972,266

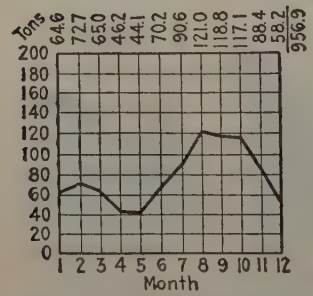
(15a)

15. If numerical data are not included in the diagram it is desirable to give the data in tabular form accompanying the diagram.



(16)

16. All lettering and all figures on a diagram should be placed so as to be easily read from the base as the bottom, or from the right-hand edge of the diagram as the bottom.



Aluminum Castings Output of Plant No. 2, by Months, 19—. Output is given in short tons. Sales of Scrap Aluminum are not included. (17)

17. The title of a diagram should be made as clear and complete as possible. Sub-titles or descriptions should be added if necessary to insure clearness.

FORMS OF GRAPHIC PRESENTATION.—There are **four** main forms of graphic presentation, which have been found most valuable in business. These are—

Bar charts	Map charts
Curve or line charts	Flow charts

BAR CHARTS.—The **great advantage** of the bar chart lies in the fact that the average individual is able to grasp and differentiate the comparative values of the various bars, or segments of bars, more accurately than is possible in the pictorial or pie chart. At the same time the vividness of impression conveyed by the bar chart is a major point in its favor. It is becoming **increasingly popular** in semi-technical and trade journals. The fact that a wide variety of

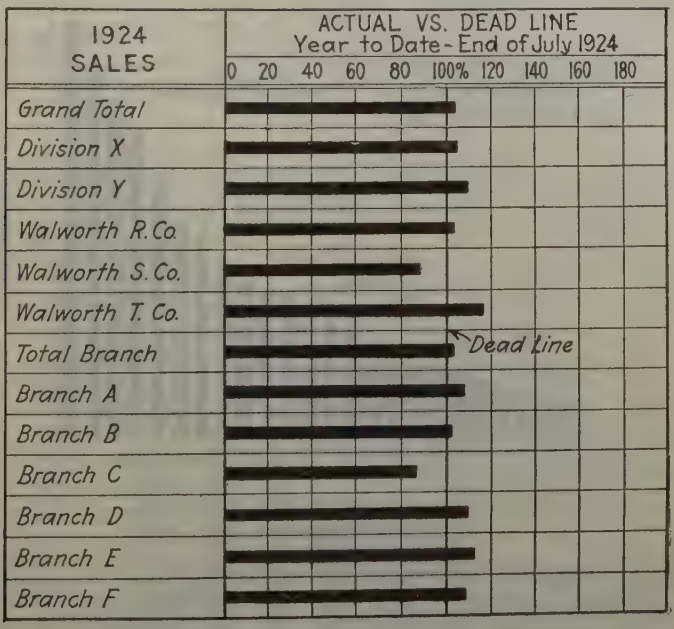


FIG. 15. Performance Comparison Against Forecast Sales

statistical comparisons can be made clear with this type of chart has led to its adoption in place of better methods. While there are some uses which absolutely require the bar chart form of presentation, it does not follow that it is the best for all purposes, and those using graphic forms should carefully distinguish the class of statistics to be presented, and then apply the proper form of graph, rather than attempt to put all statistics in bar form.

Fundamentally, bar charts are of two types—(1) **the simple bar** and (2) **the component bar.** The former is a single bar which represents a single figure. The latter is also a single bar representing a single figure but it is divided

into parts. The single figures represented by the several parts are components of the total figure which the bar as a whole represents. The component bar, therefore, may be said to represent a series of figures. The various forms of bar charts presented here are combinations or adaptations of these two elements. Primarily the principal forms of the bar chart may be grouped into **three broad classes**—(1) series of simple bars, (2) series of component bars, and (3) combination of two or more series of simple or component bars.

Series of Simple Bars.—In this case two or more simple bars representing related data are presented so that they may be readily compared. The bars may be extended horizontally or vertically (Figs. 15 and 16). This is a very simple and effective device for portraying **comparisons of single figures** whether

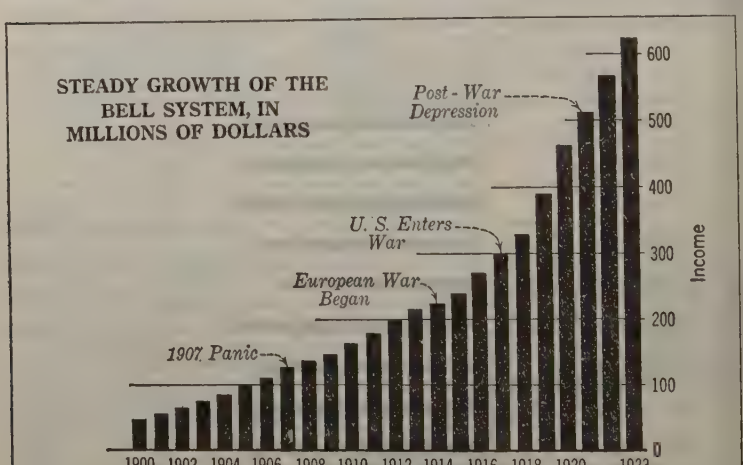

Fig. 16. Series of Simple Vertical Bars
(Bell Telephone Securities Co.)

personnel, financial, or operations. The different figures are represented by the lengths of the bars, which are projected from a common base. They may be used to represent graphically a great variety of data such as the number of employes, labor turnover, average rates of pay, expenses of different departments of the company, the purchasing, production, and selling facts of subsidiary companies, and so forth.

Series of Component Bars.—This form of graph consists of two or more component bars systematically associated. It is sometimes called a component bar chart. Each bar represents a series of figures and the group of bars two or more series of figures. There are **two general classes** of this form of graph, one in which all the bars are of equal length and the other in which the bars vary in length. The first is illustrated by Fig. 17 which is designed to show the total expenses of three railroad companies for August 1924, broken up into their component parts, and expressed in the form of distributive percen

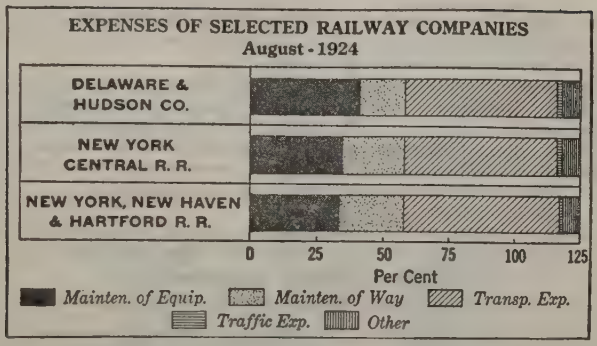

FIG. 17. Series of Component Bars—Bars of Equal Length

ages. It is sometimes referred to as the 100% compound bar-chart. Its most extensive use is in presenting data in the form of percentages. It may, however, be used to present absolute numbers as in the case of the distribution of workmen's time to different types of work, the distribution of a dollar of revenue,

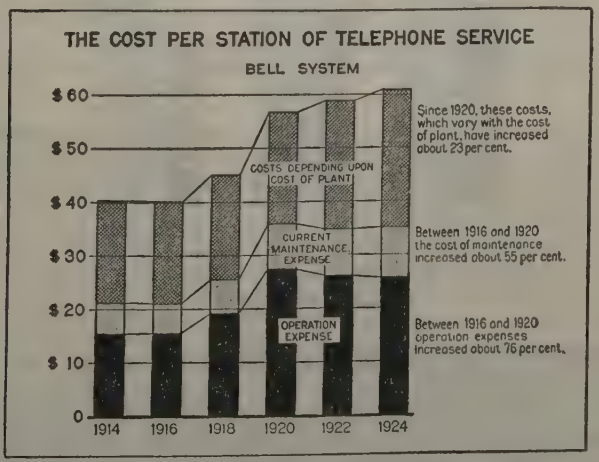

FIG. 18. Series of Component Bars—Bars of Unequal Length
(The American Telephone & Telegraph Co.)

or any other cases where the total figures in the several series are equal. The second form is typified by Fig. 18. In this case the bars, which represent absolute numbers of varying magnitude, are unequal in length. This form of

graph may be used to compare unequal absolute numbers and to break them up into their component parts, such as labor losses of the departments by causes or departmental expenses by classes.

The component bar-graph, however, is not effective for practical use. It affords ready comparison of only the series of parts which are adjacent to the base of the graph. The rest evidently cannot be well compared because they do not have a common starting point. Sometimes lines are drawn connecting the boundaries of the component parts of the several bars, as in Fig. 18; this improves the graph but does not overcome the disadvantage.

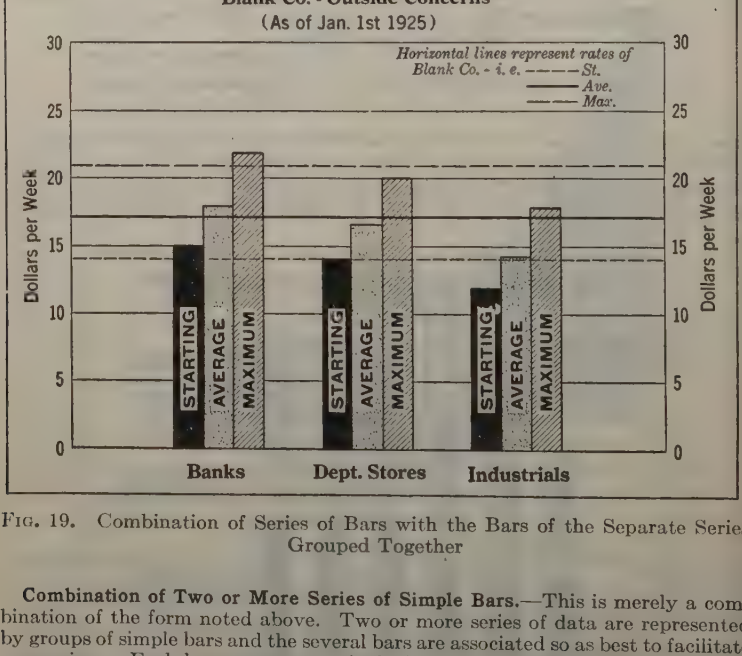

FIG. 19. Combination of Series of Bars with the Bars of the Separate Series Grouped Together

Combination of Two or More Series of Simple Bars.—This is merely a combination of the form noted above. Two or more series of data are represented by groups of simple bars and the several bars are associated so as best to facilitate comparison. Each bar represents a single figure and the different series of data are identified by distinctive markings. This form is sometimes called the multiple bar-graph. In associating the several bars, those representing each series may be grouped together as in Fig. 19, or the bars of each series which are to be compared may be grouped together as in Fig. 20. The particular method to follow in any given case will be determined on the basis of the facts of the particular situation. If the aim is primarily to compare the corresponding bars in the several series, the arrangement of Fig. 20 should be used. If the principal comparison is between the several bars of the same series the arrangement of Fig. 19 will be preferable.

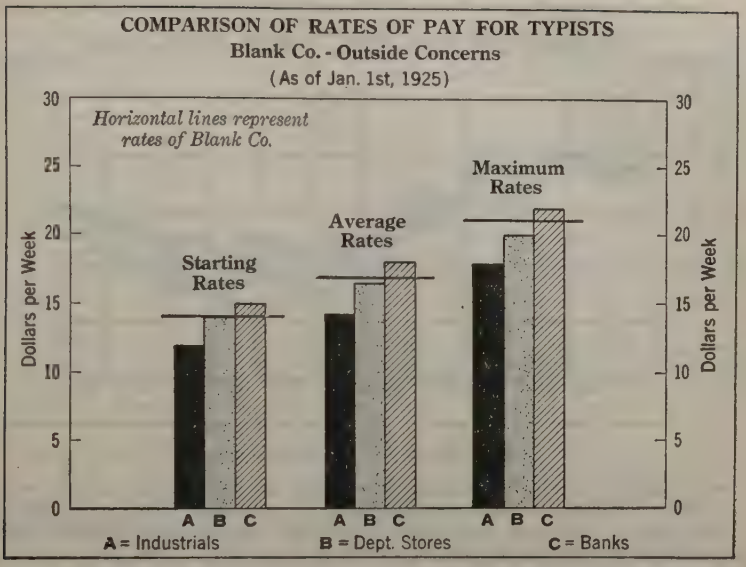

FIG. 20. Combination of Series of Bars with the Corresponding Bars of Each Series Grouped Together

CURVE OR LINE CHARTS.—In this case, the data, strictly speaking, are represented by vertical bars, but practically their magnitude is designated by points determined by the intersection of co-ordinate lines, one extending horizontally and the other vertically, from points on the base lines which, according to the prescribed scales, represent the magnitude of the data. The data are really represented therefore by the distance from the base lines to the points. Fundamentally, they are likewise of **two broad classes,** based on the character of the scales—(1) the **arithmetic** or **plain** and (2) the **geometric** or **ratio.** In the **plain scale** the vertical rulings are equally spaced—i.e., the distances between the lines which run horizontally across the chart field are equal. This is also true for the vertical lines. In the **geometric** or **ratio scale** the spacings are graduated in accordance with the logarithmic scale similar to that of the slide rule. This may apply to either the vertical or horizontal scale or both.

FORMS OF THE ARITHMETIC CURVE.—Of the arithmetic type of curve there is just one form distinct from the simple curve or group of simple curves. This is the form in which the area described by one or more curves is given prominence. There are **two principal kinds** of this form of curve—the zone curve and the band curve.

The Zone Curve.—The zone curve represents series of data principally which have maxima and minima. The data representing the series of minima and those representing the series of maxima are plotted and the space between the

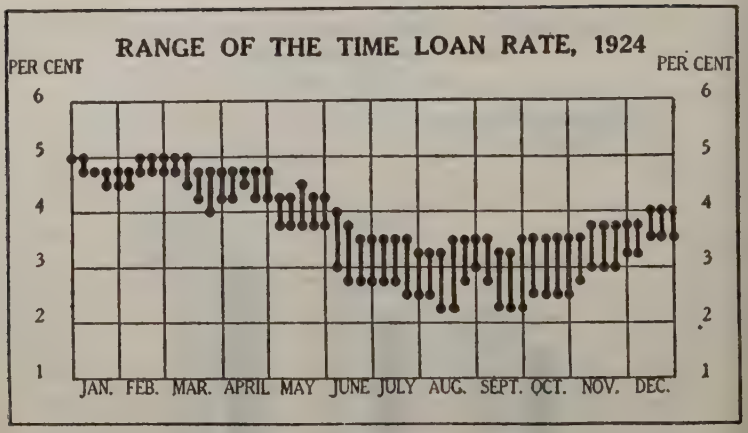

FIG. 21. A Typical Zone Curve

two is given a distinctive marking by means of coloring or otherwise cross-hatching. This type of curve is used freely in connection with security prices. The prices of the many individual sales range between rather narrow limits and are usually published showing the "high" and "low." Fig. 21 is a typical

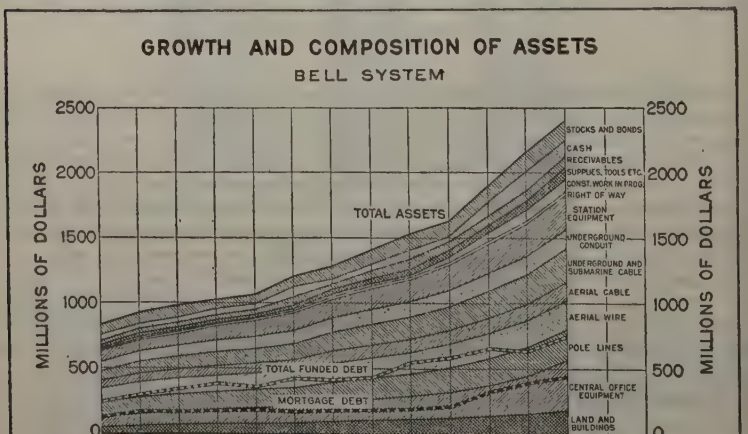

FIG. 22. A Typical Band Chart—Absolute Numbers
(From 1923 Annual Report of American Telephone & Telegraph Co.)

zone curve. **Other forms** are constructed by, (1) plotting the two series as straight line curves and filling in between, (2) plotting the two series with a year represented by a space, (3) plotting the points and connecting each pair with a straight vertical line. The average may be shown with any of these forms by dots or circles plotted between the high and low points for each time period. Other kinds of data will require this form of graph such as the rates of pay asked by applicants for positions, numbers of units per individual sale, starting and full pay rates in the community, interest rates, commodity prices, and so forth.

The Band Curve.—The band curve is used to show the **component parts of a whole.** It is similar in general character to the component bar. In its construction the various component elements are brought out through the plotting of a series of curves, the spaces between which are given distinctive markings. The several curves do not represent the separate component parts as measured from the horizontal base but beginning at the base they represent the parts cumulatively upward until the last represents the total figure. In Fig. 22, for example, the first curve from the base represents one component part, the second curve represents the first component part plus a second, and so on until the last curve represents a total of all of them. The spaces between the curves represent the component elements.

THE LOGARITHMIC OR RATIO GRAPH.—In practical statistical work in a business organization, logarithmic paper which can be obtained commercially will generally be adequate for most purposes, and hence there will be little necessity for constructing the scale.

How to Read the Logarithmic Curve.—Three different kinds of facts may be read directly from the logarithmic curve—(1) the **absolute numbers** which are read directly from the scale as in the arithmetic curve, (2) the **percentages of change** or, the ratios, which are estimated by inspection or determined more accurately by means of a scale, and (3) the **rates of change,** based primarily on the direction or slope of the curve. The method of determining the absolute numbers is simple. The actual percentages of increase or decrease, or, the ratios, will be a little more difficult. It is usually preferable, particularly for beginners, to construct a percentage scale to facilitate readings of this type. As the same percentage change will be represented by different distances on different scales, a separate percentage scale will have to be constructed for each separate chart where the scales differ. Detailed discussion of this point will be found on pages 51 to 54 of Haskell's "Graphic Charts in Business." The interpretations of the direction or slope of the logarithmic curve or portions thereof are summarized as follows on page 50 of Haskell's book:

1. If the curve is horizontal, neither ascending nor descending, the magnitudes are uniform, neither increasing nor decreasing.
2. If the curve ascends and is straight, or very nearly so, the magnitudes are increasing at a uniform, or very nearly uniform, rate.
3. If the curve ascends and bends upward, concave fashion, the magnitudes are increasing at an increasing rate.
4. If the curve ascends and bends downward, convex fashion, the magnitudes are increasing at a decreasing rate.
5. If the curve descends and is straight, or very nearly so, the magnitudes are decreasing at a uniform, or very nearly uniform, rate.
6. If the curve descends and bends upward, concave fashion, the magnitudes are decreasing at a decreasing rate.

7. If the curve descends and bends downward, convex fashion, the magnitudes are decreasing at an increasing rate.
8. If the direction of the curve in one portion is the same as that in another portion, the percentage rate of change is the same for both portions.
9. If the curve is steeper in one portion than in another portion the rate of change is more rapid in the former than in the latter.
10. If two curves on the same ratio chart are parallel to each other the same rate of change exists in both.
11. If one curve is steeper than another the rate of change in the former is more rapid than in the latter.
12. A straight line, either actual or imaginary, drawn so as to represent the general trend of a curve will show by its slope the average rate of increase or decrease of the curve; and the deviations from this average may be readily perceived.
13. A straight line, either actual or imaginary, may be drawn between any two points on the curve, between which it is desired to know the rate of change, and the slope of this line will show the rate of increase or decrease between the two points.

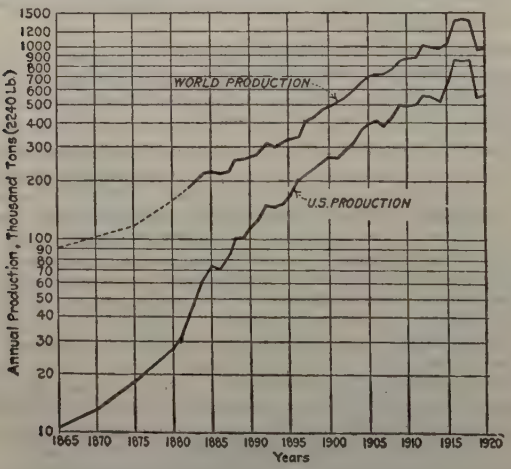

FIG. 23. A Typical Logarithmic Chart
The production of copper 1865-1920.

How the Ratio Graph is Used.—From the broad point of view, the logarithmic curve is used whenever the aim is to represent ratios or rates of change. Specifically, in practical work, it is used most extensively in the **presentation of historical data.** For the most part the forms of paper which may be secured commercially will be quite satisfactory for this purpose. The logarithmic curve will be used in presenting personnel, financial or operations data. Typical of the kinds of historical facts that may well be presented logarithmically are the number of employes, labor losses, absences, wages, expenses, revenues, net profits, production output, sales and materials purchased. The advisability

of presenting the data logarithmically will have to be decided in each specific case. Typical graphs of this form are represented in Figs. 23 and 24.

Comparative Value of the Logarithmic Graph.—The value of the logarithmic curve may be considered from two aspects. It may be compared in the first place with other methods of presenting ratios and rates of change and, in the second place, the comparison may be made with the arithmetic or difference curve. Ratios and rates of change in a series of data may be represented (1) by actually making these computations and plotting them on an arithmetic scale, or (2) by devising a scale on the grid so that the same results will be obtained by plotting the absolute numbers. The latter method has certain

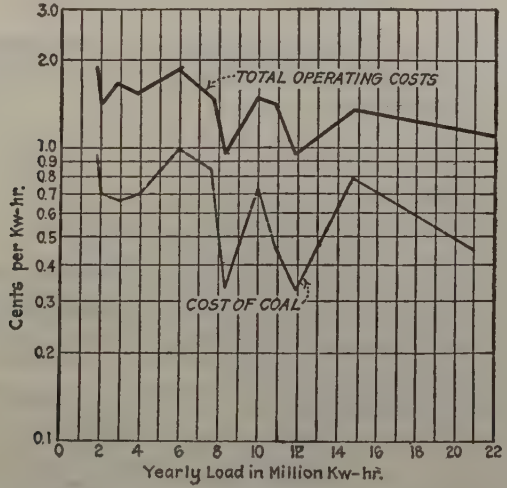

FIG. 24. Another Logarithmic Chart

Curves showing the influence of the cost of coal on the total operating cost of a large power plant.

distinct advantages. It shows the actual values, the relative values, the actual changes, and the relative changes while only a part of this information would be shown by the graph based on the computations; it avoids the necessity of selecting a base as is required in the computation of relatives; and it avoids the work of computation which in an elaborate series may be quite a burden. In the second case, the logarithmic curve is **not a substitute for the arithmetic.** They are designed to serve two separate purposes and consequently should supplement each other. It is frequently advisable to present the two at the same time, the one representing the comparison of the absolute amounts and the other reflecting the ratios and rates of change.

MAP CHARTS.—The statistical map or cartogram is nothing more than an ordinary map with statistical data graphically presented and associated with the territory on the map to which they relate. The distinctive feature of the statistical map is its **concrete representation of position.** The spatial significance

of the data is portrayed by the map and the mind is relieved of the burden of visualizing the territory to which the data are related. The real problem becomes one of representing the data on the map so that different territories may be readily distinguished or compared. The data are at hand for certain geographical units such as sections, townships, counties, groups of counties, states, and groups of states. They will usually be reduced to a per unit basis such as the population per square mile, sales per population, commodity consumption per capita, taxes per capita, and so forth. When this has been done the data are arrayed in ascending order and the highest and lowest figure noted. On the basis of this array the data are grouped into broader classes, the number depending on the character of the data and the purpose to be served in the particular case. It should be emphasized that the classes or groups should be of the same width or size.

There are different ways of representing these data on the map depending on the type of graphic mechanism selected to bring out the distinctions. Chief among these devices are colors, cross-hatching or shading, dots, and pins and ribbons, giving us what are called:

1. Color maps
2. Cross-hatch or shaded maps
3. Dot maps
4. Pin and ribbon maps

FLOW CHARTS.—The following description of flow charts is taken from "Graphic Statistics in Management" by Wm. Henry Smith.

"In some cases where component parts are not statistically comparable, it is still possible to chart them by means of some variation of the so-called flow chart. This type of figure has been extensively used in plotting **lines of authority, functions, etc., in organization work, and also in planning and routing.** It has, in addition, certain complicated and technical usages in engineering and scientific fields not within the scope of the work.

"Contrary to most other forms of charts, there is no accepted procedure or standardized practice for the construction of the various types of flow charts. The fundamental point is to choose the plan of organization or procedure desired, and construct the chart according to this plan. It is always wise, in such a case, to make a rough draft first, since in many cases it is necessary to make rearrangements in actual procedure. A chart constructed purely according to theory may not work out in practice, and, consequently, before the final draft is made, the plan should be put to the test.

The Organization Chart.—"The block and line method of constructing the organization chart is the most common, not only because it is easier to design but also because it is more adaptable to change than the more complicated forms. . . . The purpose of all organization charts is to show the exact relation each unit in the company or department bears to other units and the flow or source of responsiblity or authority. Hence, in the actual construction of the chart, it is wise to start with the source of authority and extend the chart downwards. It is sometimes necessary to find out from the men themselves just what functions they control. If there is any apparent conflict in authority, it should be settled at once and the organization chart constructed accordingly.

"Cross-section paper is preferable for use in construction of the rough draft.

"Circles may be used instead of the rectangular blocks. There is some tendency to use circles for functions, although the practice is by no means standard. The straight interconnecting lines may be replaced by curves if desired. This is possible, however, only in simple charts. Dotted lines may be

used to show relationships other than lines of authority, such as the position of committees, etc."

Planning Charts.—"A planning chart is constructed in somewhat the same manner as the organization chart, a merchandising, production, or other plan being substituted for the organization. The purpose is to prevent confusion and to show how various parts of the plan are inter-dependent and connected with the rest."

An example of a flow chart is presented in Fig. 39, page 1481.

Statistics for the Chief Executive

FUNCTIONS OF CHIEF EXECUTIVE.—Copeland in "Business Statistics" classifies the functions of the chief executive as follows:

1. To keep in constant touch with the condition of every part of his organization through the medium of constant and special channels of incoming information from every department.
2. To originate plans or policies that affect the organization as a whole and to execute his authority in keeping the various parts harmoniously adjusted and in regulating their efficiency to meet demand.

Because of the complexity of large organizations and the volume of detail involved in their operation, the exercise of control through personal observation and contact on the part of the chief executive is to a great extent impracticable. Immediate control must, therefore, be entrusted to subordinates and the true control of the chief executive is made possible and effective largely through the information which he receives from a comprehensive system of statistical reports and records. Upon these he depends for keeping in intimate touch with his business, in the formulation of his policies and in their successful execution. There are no arbitrary rules as to the specific statistical reports necessary for the chief executive. They must, of course, be apt, accurate and well presented. The following general classifications embody the **essential reports** necessary in the majority of businesses:

Internal conditions of the business
Competitors
Customers
Stockholders
Bank and credit institutions
General business conditions

The **most important statistics** for the chief executive are those relative to the internal affairs of his own organization. Such statistics may be divided into two general classes, those of a financial nature and those dealing with production and sales.

FINANCIAL REPORTS: THE BUDGET.—For discussion of the preparation and uses of various kinds of budgets the reader is referred to Section 4 on Budgets.

BALANCE SHEET AND PROFIT AND LOSS ANALYSES.—Balance sheets and profit and loss statements (see also Section 3 on Financial Statements and Reports) prepared for the chief executive should be accompanied by such analyses as will illumine facts and facilitate their interpretation. (For continuation of text see page 1467.)

FIG. 25. Chart Summarizing Important Relationships to be Noted in Financial Statements

Balance Sheet Relationships		Measures of Earnings and Turnover *		Income Statement Relationships†
A–Net Working Capital (6–16)	$225,000.00	F–% Earned on Net Worth (35 ÷ 24)	10%	P–Average Prices (27 ÷ 26), $10.00 Per Cwt.
B–Working Capital Ratio (6 ÷ 16)	$ 2.28	G–% Earned on Common Stock (37 ÷ 21)	13.2%	Q–Gross Earnings, 30% on Sales and $3.00 Per Cwt.
C–How Capital is invested—Proportion of each of items 1-10 to number 11. That is the proportion of total capital in each class of assets.		H–Cost of Borrowed Money [33 ÷ (14 + 17)]	8½%	R–Expenses, 21% on Sales and $2.10 Per Cwt.
D–Sources from which capital is secured—Proportion of each of items 13-24 to number 25. That is the proportion of capital secured from each of the various sources.		I–% Operating Profits on Total Capital (32 ÷ 11)	9.0%	S–Operating Profits, 9% on Sales and $0.90 Per Cwt.
E–Book Value of Common Stock. The sum of numbers 21, 22, and 23 divided by number of shares outstanding. Assumed Preferred Stock has no interest in Surplus and Common Stock of $100.00 par value.	$ 125.00	J–Turnover of All Capital (27 ÷ 11)	$1.00	T–Interest Costs, 2.5% on Sales and $0.25 Per Cwt.
		K–Turnover on Fixed Property (27 ÷ 8)	$2.50	U–Surplus Net Profits, 6% on Sales and $0.60 Per Cwt.
		L–Turnover of Inventories (28 ÷ 4)	$3.50	
		M–Turnover of Accounts Receivable (27 ÷ 3)	$8.00	
		N–Lbs. Shipped per $1.00 of Plant Investment (26 ÷ 8)	25 lbs.	
		O–Fixed Property Expenses % on Plant Investment (Expenses in 28 and 30 ÷ 8).		

* The turnovers are stated above as dollars of sales per one dollar of capital used. They may also be stated as the number of times per year.

† The Cost of Goods Sold item should be supported by appropriate cost statement with unit costs and ratios developed.

FIG. 27. Method of Summarizing Financial Statistics and Ratios of a Business

NOTE.—This form may be built very advantageously to compare years, preferably to show the changes from pre-war times down to date. It may be used for comparing monthly balance sheets, in which case all turnovers and measures of earnings should be reduced to a yearly basis; for example, the per cent earned on net worth per year as based on the rate of current month, etc.

James H. Bliss, in "Financial and Operating Ratios in Management," presents the following analyses as those which he considers among the more important:

1. Surplus net profits earned on stockholders' investment.
2. Operating profits earned on total capital employed.
3. Turnover of total capital used.
4. Turnover on plant investment.
5. Turnover of inventories.
6. Turnover of accounts receivable.
7. Cost of borrowed capital.
8. Cost of all capital employed.
9. Relation of fixed property expenses to property investment.

The method of presenting these data is illustrated in Figs. 25, 26 and 27.

MISCELLANEOUS INTERNAL FINANCIAL STATISTICS.—It would be a good plan for every executive to have before him a general table or chart showing the **fixed expenses** in his particular plant and the **relation of the variable expenses to sales** during a normal period. To illustrate by a simple example, assume that in a given plant the previous year's business was considered a fairly normal year. The sales volume average per month was shown to be $700,000. The fixed expense in this plant was $150,000 per month, whereas the average variable expense per month was $400,000. The chart in Fig. 28 can then be drawn showing these conditions. It will be seen that if the present business is taken on the same basis as shown on the chart, namely, if the same relation exists between the established sales prices and the cost of getting out those sales, then the particular plant in question must do a sales volume of approximately $350,000 before it reaches its "point of profit," or the point at which the plant begins to make money. In the chart in Fig. 28, the horizontal scale has no significance as the data are charted for only one given set of conditions. The width of the chart does not affect the proportion. A typical form of chart which may be used in showing how **actual profits compare with a set standard** is presented in Fig. 29.

PRODUCTION AND SALES REPORTS.—Typical production and sales reports, classified as to periods of frequency, are shown in the following:

Daily Reports:
- Orders Received (units)
- Cancellations "
- Production "
- Unfilled Orders "
- Sales (value) "
- Shipments "
- Employees Working

Semi-Weekly Reports:
- Total Orders for Week to Date (units)
- Total Cancellations for Week to Date (units)
- Total Production for Week to Date (units)
- Number of Employees on Roll and Estimated Payroll
- Spoiled or Second-Grade Product for Week to Date (units)
- Shipments for Week to Date (units)
- Sales for Month to Date (value)
- Bank Balance Compared with Previous Week and Previous Year
- Production vs. Employees
- Purchase Orders Placed with Vendors Week to Date (value)

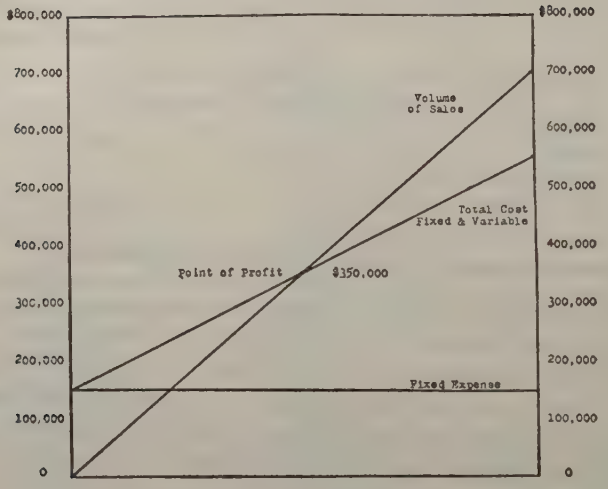

FIG. 28. Point of Profit Chart

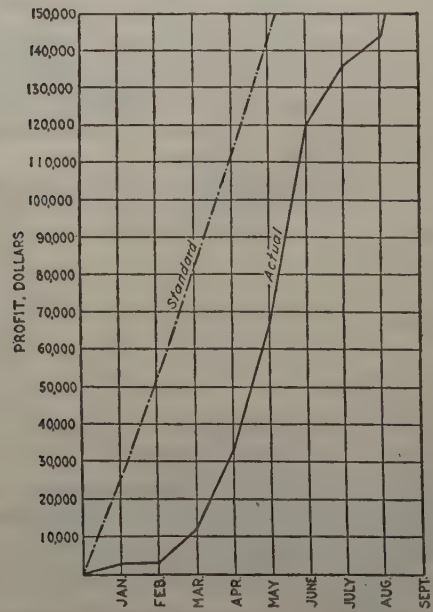

FIG. 29. Standard versus Actual Profits—Cumulative by Months

Monthly Reports:

Total Orders Received for Month (units)
Total Cancellations for Month (units)
Total Production for Month (units)
Number of Employees and Payroll
Total Shipments for Month (units)
Total Sales for Month (value)
Total Discards or Second-Grade Products for Month (units)
Bank Balance at End of Month Compared with End of Previous Month and End of Same Month Previous Year
Production vs. Shipments (units and value)

In the foregoing tabulation the suggested daily reports number seven, the semi-weekly reports ten and the monthly reports nine. In actual practice amplifications would probably be found desirable or necessary which would considerably increase the number given above.

PREPARATION AND CONSOLIDATION OF REPORTS.—Supervision of the preparation of the reports is often entrusted to an **assistant in the office of the chief executive.** Upon him devolves the responsibility for presenting to the chief executive the reports in their final form. A **consolidation of all the reports** is often made, of which an illustration appears in Fig. 30.

The **purpose of the consolidated report** is to reduce cumbersome statistics to a uniform and simplified basis without the omission of any essential facts. Properly prepared it becomes a mirror of conditions throughout the business which the busy executive may slip into his pocket and preserve for reference. The assistant in charge of reports should decide upon the **standard forms** in which he desires that information be delivered to him. Frequent changes in form multiply errors, are expensive and make comparisons difficult. In the majority of cases, semi-weekly consolidated reports at most are sufficient to be issued, for example, on Tuesdays and Fridays. The information for the Tuesday report is received in the office on Monday and includes the previous Saturday, except that sales and purchase orders are usually not so easily obtained and are available perhaps only up to the close of the next previous day (Friday). Quite frequently, to avoid delay, data are received by telephone, to be checked against written reports when they are later available. The consolidated report is typed and ready for checking early Tuesday morning. At that time all written reports should be in, and the accuracy of the consolidated report can be verified. The completed report is then carefully examined by the assistant and the **salient points noted.** A written interpolation here and there to call attention to increasing inventories or low sales, or the notation "decreasing" or "increasing" in the margin will serve to aid the chief executive in his analysis of the figures. The report should be delivered to the chief executive promptly at the same time each Tuesday and Friday, and every effort should be made to adhere closely and rigidly to the fixed schedule.

PRODUCTION AND SHIPMENT REPORTS.—There are many miscellaneous reports which might be embodied to advantage in the consolidated report. One of these is a tabulation showing the **production per man** as compared with a standard previously set. This is the report referred to above as "Production vs. Employees," in the tabulation of suggested reports. A specimen form is shown in Fig. 31.

Another tabulation of value is a **comparison of production with shipments** for the month as in the form shown in Fig. 32.

FIG. 31. Table Showing Production per Man Compared with Set Standard

As previously stated, one of the functions of the chief executive is "to originate plans or policies that affect the organization as a whole and to execute his authority in keeping the various parts harmoniously adjusted and in regulating their efficiency to meet demand." In order to perform this function the chief executive must receive currently a record of **actual production as compared with the required output** determined previously.

Excess of Shipments over Production				$2,000	

* Bold face figures indicate Increase in Production over Shipments.

FIG. 32. Comparison of Production with Shipments

REPORTS ON COMPETITORS.—The chief executive has to keep in touch at all times with the **progress of competitors,** as to sales, profits, inventories, etc. Charts showing results or achievements of the company's product compared with those of the product of a competitor sometimes disclose surprising results. Where the capital stock of a competitor is not closely held, the **financial trend of the competing business** may often be indicated by market fluctuations of its stock. Balance sheets and earning statements obtained from credit rating services, investment manuals or other sources, are often compared with similar statements of the executive's own business, in order that the comparative position of the two companies may be ascertained, either in amounts or in percentages.

REPORTS ON CUSTOMERS.—Where the scope of a business is such that it has jobbing points established throughout the country, the jobbers are often visited periodically by representatives of the business. The representative or traveler sends reports to his immediate superior (usually located in the sales department) or to the chief executive. Such reports contain facts relating not only to the jobber visited but also to **conditions as a whole in that**

particular locality—the population, principal industries, competition, etc. Through study of these reports as well as the various sales reports received, the chief executive is able to keep in close touch not only with the business as a whole but also with each particular territory in which his product is marketed.

REPORTS TO STOCKHOLDERS.—In "Graphic Methods for Presenting Facts," Mr. W. C. Brinton says:

"It is highly desirable that corporations should not only keep their old stockholders, but should attract new ones. The surest way to accomplish this end is to treat stockholders with the utmost frankness. Although considerable publicity is already given to the affairs of the larger corporations, further publicity is desirable. The average stockholder does not as a rule understand a balance sheet, and has only the vaguest idea of his company's affairs. So long as dividend payments are maintained, he is content. To be sure, a stockholder can always get an impartial and valuable opinion from an investment banker concerning the past records and future prospects of any company, but it would be well if the annual reports of boards of directors to stockholders contained material from which the investor could judge for himself to a greater extent. The material included should show the records of the company over a period of years, for the company's achievement in any one year may be unnecessarily discouraging, or fictitiously encouraging. These records are most easily understood when put in graphic form. With such graphic presentations any stockholder can learn instantly how the fiscal year under review compares with the several years preceding."

The duty of preparing such a financial report rests with the chief executive if not with the president. The following statements made by Mr. Brinton present the questions which are usually uppermost in the minds of the stockholders and which may be graphically answered.

"What figures for an annual report should always be shown in chart form to make comparisons most clear is hard to determine, but it will doubtless be agreed that, if possible the charts should attempt an answer to these questions that naturally arise in the stockholder's mind.

"1. Has the earning power of the company been maintained?
2. Is the property being kept in proper physical condition?
3. Is the financial condition sound?"

REPORTS FOR BANKS AND OTHER CREDIT INSTITUTIONS.—Where the financing of the business is accomplished through the medium of **bank** loans, information pertaining thereto is of vital importance to the chief executive. **Borrowings must be minimized** to avoid heavy interest charges, and proper control can be exercised only through knowledge of the facts. **Contact with the banks** is maintained by personal visits and by regular correspondence, so that bank officials may keep in touch with the latest available financial statements of the company, properly certified. The statements should lend themselves readily to comparisons of several past years, and the attention of the bank should be called to any radical changes in policy or financial standing.

Every business of any size is constantly requested for **credit** information, balance sheets, etc., by various organizations publishing credit services. Such information is of a more or less confidential nature and publication should be permitted only after the greatest scrutiny. **Standard practices** should be established relative to the supplying of such information.

REPORTS ON GENERAL BUSINESS CONDITIONS.—The success and growth of any business is affected not only by conditions within its own organization, but by fundamental economic factors governing prices, money rates, wages, markets and the tone of the business world at large. It is therefore necessary that the chief executive keep himself at all times well informed as to these fundamental conditions—conditions that send the business world around its perpetual cycle of succeeding periods of prosperity, decline, depression and improvement.

The Executive Note Book

PREPARATION.—By executive note book is meant any reasonably small book of record wherein are posted or kept systematically facts and figures for ready reference as an aid or guide in the management of a business enterprise. Some executives easily acquire and hold the note book habit, and constantly refer to their convenient record for facts or figures. To others this is an irksome task—something to be left to subordinates who handle the details of the business. Usually the executive note book contains an assortment of company secrets. Sometimes it becomes merely a repository for unconsulted statements, religiously kept up by a secretary, but seldom referred to. To devise a note book which contains neither too much nor too little calls for the soundest of judgment.

The **secretary or assistant nearest to the executive** is usually the one best qualified to keep the note book systematically. As letters, reports, or statements are received, facts and figures of importance are noted for insertion in the record. Sometimes the note book is kept in duplicate. Each copy can then be brought up to date, while the other is in possession of the executive, who is thus assured the use of one copy at all times.

PHYSICAL CHARACTERISTICS.—For the note book itself, a loose-leaf binder is desirable because of its flexibility through substitution of sheets. For pocket use the 3 x 5 or 4 x 6 is most popular; for desk use, the 8½ x 11. A specimen 8½ x 11 binder is shown in Fig. 33. The paper used is generally about 16 pounds to the ream of 17 x 22 sheets. For different classes of facts, different colored sheets may be used. Sales sheets may be buff; operating sheets, pink; financial sheets, grey; or the color arrangement in the case of a consolidated group of corporations may be established so that each color will represent a corporation or corporate group. Colors may facilitate reference under systems of classification, viz., by years, districts, departments, etc.

A TYPICAL EXECUTIVE NOTE BOOK.—Executive note books vary with the nature of the business and wishes of the executives. A few **typical pages** are illustrated in Figs. 34 to 43 with explanations. These sample sheets are merely indicative of certain information which has been put in an executive note book. The following general classifications summarize the usual contents of a well developed note book:

1. Balance Sheet
2. Competition
3. Corporation Information
4. Customers
5. Loans
6. Organization Chart
7. Payrolls

Balance Sheet.—The **latest condensed balance sheet** of the corporate group, or single company should be at hand. One each quarter often suffices for purposes of the executive note book. A condensed balance sheet form may be used (Fig. 35). Another similar sheet may show the **forecast balance sheet,** as an indicator of the business trend and as a guide to executive decisions.

Competition.—It is always advisable for the executive to be well informed concerning competitors, their financial condition, sales data, etc. The most useful type of information will be determined by the nature of the business. Such information should be continued on a page of the executive note book.

General Corporate Data.—The chairman of the board, president, vice-president or other officer, frequently desires to refer to certain corporate facts as to changes in capitalization, number of shares, floating debt, date of incorporation, mergers, dissolutions, directors, officers, etc. A sample condensation of those is given in Fig. 36. This is particularly useful in the case of an affiliated corporate group where memory would be taxed by the details; it also serves in cases where outside corporations are being watched either because they are competitors, or because their securities are held. Under "Remarks" a variety of information may be made available to the executive.

FIG. 42. Sales Information in Executive Note Book

Profit and Loss Statement.—The outline of a profit and loss statement shown in Fig. 41 is indicative of the general form of statement found to be useful in an executive note book.

Sales.—The forms suggested in Fig. 42 for tabulating sales may be varied to meet the characteristics of the corporate group or single company for which they are being compiled. Further detail may be added by analyses according to principal products.

Standard Practices.—The standard practices of the company may be:

1. By-Laws
2. Duties of Officials:
   - (a) Treasurer
   - (b) Secretary
   - (c) Auditor
   - (d) Other officials
3. Any other statement of Standard Practices, Rules, Codes, Policies, etc.

Vendors.—The company's principal vendors are listed, the main commodities supplied, and, in round figures, the amount purchased annually, in dollars, as shown in Fig. 43.

Vendors

Name	Commodity	Yearly Aggregate

Fig. 43. List of Vendors, etc.—Executive Note Book

The Statistical Department

PLACE OF THE STATISTICAL ORGANIZATION IN THE COMPANY.—The statistical organization may be located at various places in the company, according to the way it has grown up, and good statistical service is being rendered in practical business concerns by statistical organizations having different places in the company. Generally, however, it is preferable to have the statistical organization located **in the accounting department** with the chief statistician reporting to the head of that department. This is because of the fact that the accounting department in its routine functions maintains records of a great amount of statistical detail and as a matter of fact the system of basic statistical records will perhaps be preferably built up through an expansion and elaboration of the regular accounting records. Furthermore, in much of the statistical work the data must check with the official figures of the accounting department and the **close association of the two organizations** facilitates co-operation along this line. An advantage may, likewise, be realized through co-operation in the use of mechanical aids.

CENTRALIZED VERSUS DECENTRALIZED STATISTICAL ORGANIZATION.—The statistical organization may be centralized or decentralized in form. In the one case, (1) the chief statistician is immediately and directly in charge of the complete program of statistics, (2) the entire statistical force is centralized under his direct supervision, and (3) a comprehensive system of primary basic data records is maintained in the statistical organization. (See Fig. 44.) In the other, (1) the chief statistician only remotely and indirectly supervises the statistical work, (2) only a supervising nucleus of the statistical force is located in his office, the bulk of the force being distributed among the several departments of the company in the form of operating units which are under the direct supervision of their respective departments, and (3) primary basic data records are to be found for the most part only in the several departments of the company with or without special organization or systematization to facilitate statistical work. (See Fig. 45.)

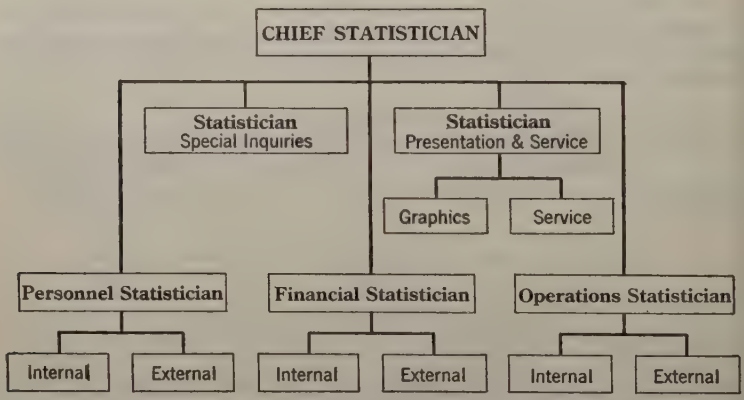

FIG. 44. An Organization Chart Representing the Centralized Type of Statistical Organization

With an executive statistician at the head and staff statisticians in charge of personnel, financial, and operations statistics, special inquiries, and presentation and service.

Which of these forms of organization is preferable will depend to some extent on the organizational character of the particular establishment that the program of statistics is designed to serve. Frequently, the policy of the business is one of decentralization and this may at times be a controlling factor in determining whether the statistical work shall be centralized or decentralized. There are, however, certain fundamental considerations which play an important part in deciding the type of organization. The business concern may be a simple organization as in the case of most smaller companies, or it may be made up of a number of associated companies as in the case of some of the larger American corporations. Furthermore, all the operations and employees of the concern may be grouped together under one roof or in one locality, or through branches or geographical divisions they may be scattered over a wide territory with the several parts of the organization widely separated over the country or even over the world. Where the business organization is widely

separated it is imperative that the statistical work be likewise decentralized. The question of the comparative value of the centralized and decentralized type of statistical organization has to do specifically with the simpler type of organization where the operations and forces are concentrated at least in one locality.

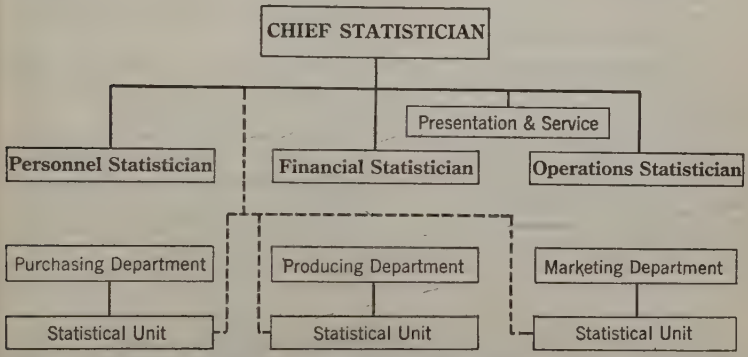

FIG. 45. Organization Chart Suggesting the General Form of the Decentralized Type of Statistical Organization

THE CENTRALIZED ORGANIZATION.—The following points are generally noted to indicate that the centralized organization is preferable:

1. Accuracy.—The centralized statistical organization is better prepared to guarantee accurate results since it keeps under the immediate supervision of the head of the statistical organization the entire work of developing statistical statements, from the primary basic records to the completed study.

2. Relieves the Departments.—The centralized statistical organization conforms to, and the decentralized statistical organization conflicts with, the principle of management which prescribes that the operating department of a business organization should be relieved of all burdens of the business except those associated directly with operations.

3. Statistics a Main Job.—When the statistical work is centralized the entire development is under the immediate supervision of the chief statistician and his staff, whose chief function in the company is to do statistical work. When this statistical work is done in the several operating departments—when it is decentralized—the supervision is done by those whose main jobs are not statistical compilations but operating work. The immediate supervision of the chief statistician is far preferable. This is his main interest. He studies statistics and equips himself to do the best kind of work in this field.

4. Uniformity.—A centralized statistical department insures uniformity of treatment both in the organization of the work and in its detailed development.

5. Avoids Duplication.—The centralized statistical organization tends to avoid duplication both of effort and working force.

6. Mechanical Aids.—In the larger industrial organizations, where the use of the tabulating machine is required, the centralization of primary basic

records is next to imperative. The waste in time and energy involved in the introduction of the tabulating machine in a decentralized organization is avoided.

7. Comparative Departmental Figures.—One of the widest fields of service in the development of statistical data lies in serving the general officers with comparative departmental figures. When these figures are prepared separately by the several departments there is no assurance that the treatment of details will be identical and the final figures comparable.

THE DECENTRALIZED ORGANIZATION.—On the other hand, the decentralized organization offers certain **advantages** which frequently outweigh all of those listed above in favor of the centralized concept.

1. Service to Department Heads.—It is important for the heads of departments to be familiar with the facts of their respective departments as well as for the general executives to have the facts of the company. The decentralized statistical organization affords a better opportunity to serve the department heads than does the centralized type. If the operating department is responsible for organizing and analyzing the facts of its own organization it will be more familiar with the facts and hence be better able to draw conclusions therefrom and establish policies and practices in accordance therewith.

2. Eliminates Duplication of Records.—A further advantage of the decentralized type is that it tends to eliminate the duplication of records which is required in the centralized organization. The operating departments must have their records for purposes of operations and the maintenance of a second set in the statistical department is definite duplication. The elimination of this may result in a substantial economy.

3. Statistical Department Unfamiliar With the Facts.—In the centralized type of organization the figures are worked up entirely by the statistical organization without the inspection of the department or division heads. These figures presented to the executives may give the impression that something is seriously wrong and may lead to a request for an explanation from the department or division head.

PRACTICAL FORM OF ORGANIZATION.—From the practical standpoint, satisfactory statistical service can be rendered through either type of organization. In strict theory, the centralized type is perhaps preferable but rarely if ever in practical business affairs can decisions be made on a strictly theoretical basis. In nearly every question of management that arises there are important practical considerations and the formulation of a statistical organization is no exception. As a matter of fact, in practical work there is generally **a combination of the centralized and decentralized type. External basic data** generally and such internal basic data as are centrally recorded—perhaps payroll, labor turnover, sales or financial facts—as well as all company statements and departmental comparisons will be handled by the central organization. Other data, particularly **detailed operations facts** related specifically to the several departments, may be handled separately by the respective departments. The facts which are worked up by the departments are then generally reported to the statistical organization, not in their original detail, but in a more or less classified and summarized form, from which company and comparative departmental figures may be prepared. What basic data will be maintained in the statistical organization and what in the other departments of the company will have to be decided in the light of the facts of the particular situation, the practical aspects of which will usually be the determining factors.

The statistical organization should be in the form that will best serve the particular company and it is unfortunate indeed for the practical statistician to undertake abruptly to bend the form of the statistical organization to suit some theoretical standard rather than to have it fit in with the organization and practices of the company. Figures 44 and 45 illustrate the general forms of the two different types of organizations but these are merely suggestions to aid as a guide in the development of the organization and are in no sense set down as the only forms of successful statistical organization. It must always be borne in mind that the statistical organization in a practical business concern may be of any form and size. It may be a single unit in the accounting department; it may be made up of several units in the different operating departments; or the statistical work may be done incidentally by the regular operating organization. The last method is in operation for certain classes of data in practically every concern and it is the preferable way of handling the statistics which are specifically applicable to the operation of a single department.

THE PERSONNEL.—The selection of proper personnel is one of the most important considerations in the development of a program of statistics. The organization charts in Figs. 44 and 45 suggest in general the type of personnel required. From these charts it will be observed that the following broad types of employees are required:

1. Executive statisticians
2. Staff statisticians
3. Expert statisticians and technicians
4. Statistical clerks

The Executive Statistician.—The executive statistician is the one whose chief responsibility is the **executive direction of the statistical organization.** The following are among his principal **qualifications:**

1. Administrative Ability
2. An Appreciation of the Services of Statistics
3. Disciplined Imagination
4. Familiarity With the Business
5. Statistical Technique
6. Practical Minded

The Staff Statistician.—The staff statistician may be designated as an **assistant to the executive statistician,** who is immediately in charge of the development of the statistical work in whole or in part. In the organization charts, Figs. 44 and 45 above, provision has been made for staff statisticians in charge of personnel statistics, financial statistics, operations statistics, special inquiries, and presentation and service.

Statistical Experts.—These are employes who are specially **equipped in the technique and philosophy of statistical method.** The personnel, financial, operations, and graphic staff statisticians all will have assistants who are specialists each in his own field. These experts will give their entire time exclusively to the study of problems in their respective fields and will thereby give to the staff statisticians expert advice in the various phases of the statistical program. The **chief qualifications** of the statistical expert are: (1) familiarity with the statistical methods required in the organization, analysis, and interpretation of the type of data for which he is responsible, and (2) a thorough knowledge of the important facts in his special field.

Statistical Clerks.—This classification will include the office force of all classes: stenographers, typists, machine operators, draftsmen, and all kinds of

clerks. While the selection of this class of employes is not generally so difficult as is the case with the executive and staff statistician, nevertheless it is highly important that they be carefully selected in the light of the special type of service they are to render.

APPLIANCES.—The element of cost enters into the statistical department to the same degree as in any of the other departments of the organization. To justify themselves, statistics must be produced at a minimum cost—a cost which will repay their existence. When methods of tabulation are too laborious, there is a tendency for errors to creep in despite the utmost care. The **use of mechanical devices** often reduces costs and minimizes the probability of error. Among the most widely used appliances for this purpose may be mentioned the **Hollerith Card Sorting Machine,** which is suitable for statistical work relating to sales, costs, etc., and the **Hollerith Tabulating Machine** for totaling the data contained upon the cards. Both of these machines are very flexible in their nature and are readily adaptable to any situation in which the statistics are entered upon cards. The United States Bureau of Census has made wide application of these two machines very advantageously.

Calculating machines while not specifically designed for statistical work are ordinarily part of the equipment of every such department. Special equipment for containing the completed statistics and presenting the same to the best possible advantage is rapidly finding favor. Such equipment includes swinging leaf display fixtures for displaying maps, charts, etc., large wall maps, map cabinets, devices using colored pins and mechanical bar charts. Many devices of similar character, each having advantages and disadvantages, might be enumerated. Problems of the statistical department will repay careful study, to the end that wherever volume of data handled and probable reduced costs point the way, the executive may consider the installation of such labor saving equipment as seems best suited for his particular problem.

SECTION 30

CONTROLLING SALES AND SALES EXPENSE

The predetermination of profits and costs on the basis of budgeted sales is the most effective means of securing profitable operation. For each major and minor department **standards of performance** should be set up, so that against these standards actual performance can be checked periodically.

Principles and Procedure of Determining Flexible Budgets

FLEXIBLE STANDARDS.—To establish departmental standards of performance, it is necessary to determine some form of expression of results suitable alike for all subdivisions of the business, and at the same time flexible enough to enable the setting of standards which can be readily adjusted to the changing conditions of industry. Hence it is at the outset necessary—

1. To discuss the preparation of the sales budget in its relation to enterprise as a whole.
2. To explain the determination of flexible standards for indicating the results of each department or organization unit under varying conditions of industry.

In other words, the standards should be flexible as business is ever changing and no two years are exactly alike. Consequently the amount of sales will also vary from year to year. Then, too, most industries are seasonal, and also, the amount of business done in particular seasons is likely to vary on account of weather conditions, good or poor crops, business depressions, etc. To manage a business effectively it is necessary to know costs from week to week and month to month with reference to sales in order to see how the organization will come out at the end of the year. Standards which reflect conditions in this way will help the management to attain a certain amount of profit during a given period.

THE SALES BUDGET.—The basis for all forecasts and estimates is the volume of sales expected, since sales is the source of the operating income. It would thus seem that the sales estimate should be the first budget to be made up. However, the best program for the organization as a whole contemplates close co-ordination of the activities of all the departments of the company, and in some cases it may be necessary or expedient at least to consider the production or finance department first. In most instances the initial step in the budgetary program is made by the sales department. The sales organization is more closely in touch with the marketing conditions than any of the other departments. On account of changing marketing conditions and the producing facilities of the individual concern a well-balanced sales program requires much careful planning. A detailed discussion of the procedure of determining the sales quota or budget is given later. There are, however, certain general

aspects pertaining to the volume of business that need to be understood in connection with the sales quota.

THE VOLUME OF SALES.—Having decided that the budget program should begin with the sales budget, the **first problem** to be solved is the volume of sales to be budgeted for the next year or budget period. The solution of this problem depends on several major considerations. First, it must be recognized that volume of sales is dependent upon the **amount of money spent in sales effort** to secure sales. By increasing the advertising budget and the number of salesmen in the field, the sales will increase; so will the expense. A sales program cannot be considered without taking cognizance of the cost in the way of selling expense, i.e., how much the company wishes to spend during a given period for sales effort. Secondly, the sales program should be carefully considered in relation to the **production facilities** of the plant. A majority of the industrial plants under normal conditions have surplus producing capacity and hence a relatively large amount of fixed expense. As the volume of sales is increased the unit cost of production decreases, because the **overhead** is distributed over a larger number of units of products. Under such conditions careful estimating of costs is necessary in order to bring sales and production into proper co-ordination and adjustment. Theoretically, the goal toward which to work from the point of view of profit would be to secure that volume of sales which would yield the greatest net return on the capital invested consistent with the growth of the business and the policy of expansion. So, in making up the sales estimate for the budget period, among other things, the following points should be given careful consideration:

1. The fixed and variable expense of the concern.
2. The "profit-point."
3. Selling prices of individual commodities or classes.

FIXED AND VARIABLE COSTS.—An expense in connection with operating a business is an outlay of capital, either for goods or for services. In cost accounting the outlays for materials and direct labor, as incurred in manufacturing industries, are usually spoken of as "costs" while the expenditures for supplies and indirect labor are called "expenses." For the purpose of this discussion "expense" and "cost" will be used synonymously.

In conducting a business various expenditures need to be incurred. Some are necessary whether the plant is operating or idle. Other items of cost vary in proportion to the operations whether they be manufacturing or selling. There is a third group which is fixed to a certain extent but also varies somewhat with the output. From the standpoint of regularity of occurrence costs may be classified as follows:

1. Fixed or capacity expenses
2. Partially variable expenses
3. Variable expenses

Insurance, rent, taxes, the president's salary, bonded indebtedness, etc., are illustrations of **fixed expense.** Among the **partially variable expenses** are such items of cost as depreciation on machinery, equipment, automobiles, etc. A certain decline or lessening in value will take place in this type of assets regardless of whether or not the plant is in operation. The rate of depreciation, however, will be greatly accelerated with regard to some assets when the plant is operated to capacity. Among the **variable cost items** which vary directly with output are direct labor, cost of materials, etc.

A classification of costs as given above is very helpful in analyzing operating problems and in obtaining unit costs. However, for the purpose of making

flexible budgets of cost standards on volume of business as will be explained later, it is important to consider costs under two headings: Fixed, and variable. As used here these two classes of costs may be defined by the following extract quoted from "A Technique for the Chief Executive," by John H. Williams, Bulletin of the Taylor Society:

"**Fixed cost** is that part of cost which exists irrespective of fluctuations in volume of business within a range of the smallest volume of business which there is reasonable probability of doing up to the practical capacity of the plant. In it are included such items as: rent, depreciation; salary of executives, and a minimum number of accountants and clerks; payroll for shop superintendents, foremen, watchmen, etc.; property and corporation taxes; interest on funded debt; etc. It should represent only such items and parts of items as are regarded as essential to the conduct of the business at the established minimum volume and are independent of fluctuation because of increase or decrease in volume of business.

"**Variable cost** is that part of cost which should vary in proportion to the volume of business. It comprises such items as: materials; direct wages; supplies; upkeep; salary of minor executives, accountants and clerks; payroll of assistant shop superintendents, foremen, etc., income taxes; interest on floating debt; stock dividends; etc. It should represent only such items and parts of items as are not essential to the functioning of the business on the basis of the established minimum."

It should be evident from the above definitions and illustrations of fixed and variable costs that the basis for this classification is not so much a distinction between such items as interest on bonded indebtedness representing a fixed cost, and material, direct labor, etc., representing a variable cost, as it is a division of the various items of expenditures. For example, a portion of the office salaries and the salesmen's expenses is fixed, while part of it is variable and should vary with the amount of business secured. Many other expenditures belong in the same category.

Even in a period of very dull business there are certain expenditures connected with manufacturing, administration, and selling that must go on no matter how small and few the orders are. Only by selling the business can these expenditures be eliminated. When such a step is not taken, the plant equipment must be preserved against excessive deterioration. A skeleton organization at the plant as well as in the selling and administrative divisions must be maintained. In every business there are certain fixed costs which fluctuate very little whether volume of sales is $700,000 or $12,000,000. In the fixed cost is included such items as administrative salaries, bonded indebtedness, office expenses, and the fixed selling expenses, such as the salaries of the sales department, and the advertising expenses necessary to keep the product known. Among the fixed costs are also included a portion of the indirect payroll of the factory comprising the salary of the superintendent, and of the foremen whose services are needed regardless of the volume of goods produced. There are, in addition, the stock clerks in the production departments, tool-room keepers, checkers, inspectors, etc. Certain other items of fixed expense are insurance, taxes, rental of telephone, depreciation, etc. All these items of costs go on regardless of the volume of sales. Thus a certain portion of the expenditures in all departments is fixed while a portion is variable.

THE "PROFIT-POINT."—Because of the fixed costs a certain **minimum amount of business** must be done until the "profit-point" is reached. Any amount below that results in a loss, while every dollar's worth of sales above that figure yields a profit. The **"profit-point" volume of sales** is that volume

of business which results in neither a profit nor a loss, i.e., the business "breaks even." If the variable cost as defined above varies with the volume of business but is always the same per cent, while the fixed cost remains the same irrespective of fluctuations in volume of business, the difference between the variable cost and 100% as representing the business done, may be regarded as contribution to fixed cost or profit. Stating this in another way, if the total variable cost for example is 80%, or $.80 of each $1 of sales, 20%, or $.20 out of each $1.00 worth of sales, is available for paying off fixed cost until it is completely offset, and thereafter this margin is profit.

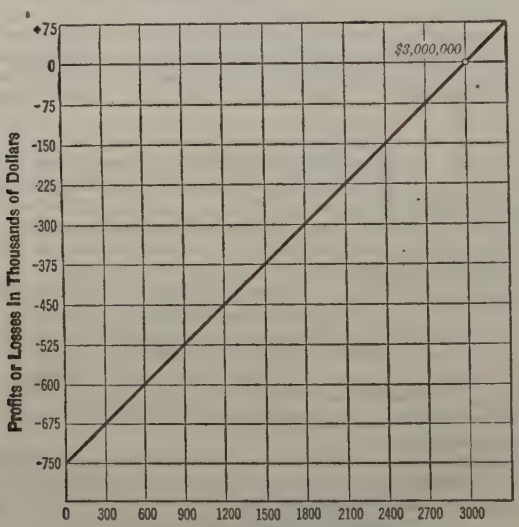

Fig. 1. Profit-Point Chart

Illustration: Suppose fixed costs of manufacturing, selling and administration in a certain concern are $750,000 per annum and the per cent of the total variable cost amounts to about 75% of the sales. How much business must be done before the "profit-point" is reached? Under these conditions every dollar's worth of sales yields a margin of $.25, a contribution to fixed costs and profit. It will require as many dollars' worth of sales to reach the "profit-point" as $.25 is contained into $750,000 which is $3,000,000; that is, $3,000,000 is the "profit-point." Fig. 1 shows graphically the profit and loss resulting from various volumes of sales.

"PROFIT-POINT" ILLUSTRATED.—The relation of fixed to variable cost depends to a large degree on the capacity of an establishment with reference to the amount of business that it can get to keep its departments busy. For example, take two companies, A and B, in the same industry, manufacturing and selling the same type of goods. Company A can manufacture and market $2,000,000 worth of goods per month, but on account of a decrease in demand it sells only $1,000,000 per month. B has the capacity to produce and sell

$1,000,000 per month but only does $900,000 of business per month. The plant capacity of A is larger than is necessary for its present needs, and therefore, it has a great deal of idle equipment and other fixed charges which go to make up a higher fixed cost of doing its volume of business. On the other hand, B's plant is just slightly larger than is necessary for its current volume of business. Obviously, the breaking or "profit-point" of the two establishments will involve different amounts of business. If the fixed cost in plant A is $270,000 and its variable cost 70%, or $.70 of every dollar of sales, while plant B has a fixed cost of $120,000 and a variable cost of 80%, or $.80 of each dollar of business done, how much business must be done by each plant to "break even"? To determine the "profit-point" for company A at which there will be neither gain nor loss, $.30 is divided into $270,000 which gives $900,000 per month as the "profit-point." That of B is similarly obtained by dividing $120,000 by $.20, which equals $600,000.

To ascertain how much profit each concern yields if the fixed and per cent of variable cost is as stated above and the volume of sales per month for each concern is $1,000,000 and $900,000 respectively, the computation is as follows:

Company A:	Variable cost, 70% of $1,000,000	$700,000
	Fixed cost	270,000
	Total cost	$970,000
	$1,000,000 minus $970,000 equals $30,000 net profit.	
Company B:	Variable cost, 80% of $900,000	$720,000
	Fixed cost	120,000
	Total cost	$840,000
	$900,000 minus $840,000 equals $60,000 net profit.	

Carrying the illustration still further, suppose company B continues to sell to the amount of $900,000 per month, but its fixed cost is reduced from $120,000 to $80,000, how much business will it find necessary to do to break even? Assuming the same variable cost as given in the illustration above, and applying the same procedure as before, the answer is $400,000 per month ($80,000 divided by $.20 equals $400,000). Again, suppose the fixed cost remains unchanged but the variable cost is reduced from $.80 on each dollar of sales to $.70, where will the breaking point be? If the variable cost is $.70 on every dollar's worth of business obtained, $.30 on each dollar of business will be applicable to the fixed cost. Consequently, by dividing $120,000 by $.30 we get $400,000 per month as the answer. Going back to the first illustration of company B, when the "profit-point" was $600,000 of sales per month, its loss in case the sales dropped to $450,000 per month is determined as follows:

The fixed cost is	$120,000
Variable cost 80% of $450,000	360,000
Total cost	$480,000
Sales	450,000
Loss	$ 30,000

These illustrations show the significance of—

1. Obtaining a certain volume of sales.
2. Predetermining the possible volume of sales through the various sales outlets together with an estimate of the cost of selling.
3. Having the chief executive, the sales manager and the controller get together and figure out what the real possibilities of profits from the business are, and then make plans to realize as nearly as possible the profit-making capacity of the concern.

SALES VOLUME AND SELLING PRICES.—Usually the volume of sales can be increased in two ways:

1. By reducing the price of the merchandise sold.
2. By increasing the normal sales effort through advertising, salesmen in the field, etc.

When the volume of sales is increased, the **unit cost of production** will decrease until the point is reached where it is necessary to make plant extensions. Hence, by increasing the volume of sales up to that point, lower production costs will result. On the other hand, sales expenses as volume of business is increased have in normal times a tendency to increase. To overcome competition more money must be spent for advertising and personal solicitation by salesmen.

The point to be emphasized here is that **production costs and sales costs** do not move together. Nevertheless, a certain portion of the selling costs in every business will go on whether the orders are few or many. There is a certain amount of advertising expense which is incurred irrespective of the amount of business done. A company operating branches also has other fixed charges in the form of rent, interest, salaries of sales executives, and minimum salaries of branch managers and salesmen. The **proportion of the fixed cost to the variable cost in selling operations,** however, is far less than in plant operations. Consequently the "profit-point" with reference to the amount of business done comes much earlier in selling operations than in production.

SALES ESTIMATE IN RELATION TO PRODUCTION CAPACITY.—Not infrequently sales managers, in particular, are not aware of the effect of volume on both the production and selling cost and the necessity of keeping up a volume of sufficient size to take care of the fixed costs. It is highly important therefore to have the accountant or comptroller prepare an estimate of the volume of sales indicating the amount necessary—

1. To "break even."
2. To earn a reasonable return on the capital invested.

For example, an estimate should be made indicating what the net profit on the investment would be for different amounts of sales not only through the regular channels but through all possible sales outlets, and what the estimated net returns would be if the plant were operated at or nearly full capacity. Such calculations, among other things, comprehend not only careful estimates of production, selling and administration costs but of price policies.

In preparing a sales estimate for a company as illustrated in Fig. 1 sales can be profitably solicited, after the $3,000,000 volume is reached, at less than the regular sales prices **by disregarding the fixed charges.** Obviously every dollar's worth sold after the "profit-point" has been reached yields a good margin of profit as no overhead charges need to be considered. It might be argued that it would not be practicable to sell a portion of the output at a different price, particularly in the case of those concerns making but one line, such as adding machines, cash registers, and harvesting machines. However, some organizations get around this objection by selling a portion of their output in foreign countries at a lower price than in the domestic market. Others which make a varied line of products, sell the major portion of their output through their own sales organization under their trade name, and market the balance unbranded to large outlets as mail order houses, department stores, or other large distributors. In this way it is also possible to dispose of some goods which may be off-grade without affecting their regular trade-marked products. This practice is common in industries such as automobile accessories, packing, and rubber tire and footwear.

With estimates as a basis, the sales manager can be shown what volume of sales in each of the lines is necessary to earn a **normal profit** and the amount needed to "break even." This can be further illustrated by means of charts prepared at the end of the budget period giving the following data:

1. The sales quota or estimated volume of sales.
2. The amount necessary to "break even" (if that is possible under the conditions of operation).
3. The actual sales volume.

Such information would be very helpful to executives in planning their policies. There may be certain units, i.e., separate plants as are found in large organizations, which because of their heavy fixed charges cannot do enough business to "break even." It is nevertheless important to know under what conditions they might be made profitable.

PRICING OF COMMODITIES IN SALES BUDGETS.—Not only need the effect of increasing sales volume through increasing sales effort be carefully considered in connection with production costs, but the question of **prices on individual commodities, or classes of goods,** also warrants careful consideration. While it is desirable that a profit should be obtained from the sale of each item and that those articles which do not yield a satisfactory profit be discontinued, for various reasons this cannot always be done. Under modern competitive conditions it is not always practicable to base unit sales prices upon unit cost of producing them, as is generally supposed. In the better managed concerns costs are seldom considered until a **logical sales price** has been determined. In making up the schedule of the selling prices of the various articles a concern has to consider the prices charged by other concerns for similar products and also the prices for those goods which may be substituted. For example, a manufacturer of rubber goods and footwear of all types would in fixing a selling price for rubbers have to consider the price charged by other companies which also produce rubbers, rather than figure first the cost of manufacturing this product and then determine the selling price. One company usually can produce some commodities at a lower figure than competing concerns, and vice versa. The principal consideration in setting unit selling prices is to produce the **most favorable aggregate result.** Certain articles may be sold at cost or even at a loss, as a leader to meet certain competition, or to keep the plant going, or for other reasons. For example, sometimes it is necessary on account of competitive conditions to sell certain items in order to meet the sales demand for a complete line of articles. For instance, in the sale of valves, dealers find it necessary to carry several sizes in order to meet the demands of their customers. Some manufacturers produce all these sizes so that other manufacturers, in order to meet the demands of dealers, may be required to carry a complete line for fear the dealer will place his order with the manufacturer from whom he can obtain a complete line. That a complete line may be maintained, it may be necessary for the manufacturer to produce certain sizes which he is unable to produce and sell at competitive prices without incurring a loss.

In considering the profit of the sales estimate, the **problem of providing complete lines** in certain industries should be given careful consideration in order that certain items will not be eliminated so as to affect the sales volume adversely. Notwithstanding, there has been a tendency in business in the past of giving too much attention to the complete-line idea. Considerable attention was given to the standardization of items during the war and after the close of the war. This is exceedingly important, as great economy can be

effected by simplification of products. In the average industry the following steps are suggested for making up **price schedules** of products:

"1. List all of the articles.
2. Determine the articles with which these will compete, and head up a column for each of the principal competitors.
3. Fill in the price at which these competitive articles are sold.
4. Determine and fill in the price, under the circumstance of your sales campaign, at which you believe you can produce the desired volume of sales.
5. Put down your own unit cost.
6. Review all of the facts and make such unit prices as you believe necessary to the end of producing the most favorable aggregate result." ("Technique for the Chief Executive," by John H. Williams, Bulletin of the Taylor Society, April 1922.)

After the most profitable sales program from the standpoint of **aggregate net profit** has been determined consideration should be given to the varying margin of profit on different lines or classes of products when making up the salesman's quota, and the sales compensation system should be so planned that it will be to the interest of the salesman to put his selling effort on the more profitable lines.

RECORDS IN TERMS OF LIST PRICE.—As prices fluctuate, in many lines it frequently is necessary to sell at a different price than the anticipated sales price at the time the budget was made. Accordingly, it is customary for manufacturers and wholesale dealers in making up their catalogue for the trade to enter the commodities at a "list price." Depending upon the sales policy of the individual business, this may or may not be the selling price all dealers pay. Usually it is the basis on which sales prices are based. Any deduction from the listed figures is a trade discount.

Trade discounts are rarely recorded on the books; only the net sales price is credited to the sales account. Under conditions prevailing in many businesses this may give satisfactory control over sales activities. There are, however, advantages from the standpoint of establishing standards of control of each organization or department, in keeping the books in terms of list price and in recording the selling or trade discount as a selling expense. This is done as follows: On the basis of the sales estimate or quota expressed in units of product and list selling price, i.e., the price at which each is to be sold to dealers or consumers, each organization unit in each department computes the cost of operating as a certain per cent of the list price. Starting with the production division, take an item, A, having a list price of $1 and determine what per cent of its price will be taken up in manufacturing. Assume that 50% will be absorbed in producing it. In the same way, each organization unit estimates its cost of operation for handling the products. When the budget is completed the per cent of the sales price at list necessary to operate each organization unit will have been determined, and this will serve as a standard against which actual performance can be measured.

How this procedure will aid **sales control** will be seen from the following. In the first place, discounts allowed, to a certain extent, may measure the efficiency of a branch manager. The sales manager who is able to make his quota with the smallest amount of sales discount, other sales conditions being equal, is naturally the most efficient manager. Consequently, there should be a record of the amount of trade discount taken by each branch manager. It might be argued that when concerns bill their goods to their branches at list,

as is the custom in some organizations, the prices are fixed by the head office so that the branch manager has no discretion over prices. However, even when this is the practice the local manager is usually given some leeway in the matter of prices, particularly with regard to selling to the larger dealers or customers. That is to say, the manager can within certain limits give a discount from the regular selling price. Secondly, when a concern distributes its products through various channels, as through its own branches, jobbers, agents, brokers, etc., the recording of sales uniformly at list and the discount from the list as a selling cost, the per cent of selling expenses to sales under these different methods of distribution is comparable. This is not possible when sales are recorded at their net price. For example, suppose the net sales prices are recorded and 10% is allowed on the goods billed to a company's own branches because it bears the branch cost, and 15% is given to jobbers because they finance themselves. The net results under these conditions are misleading. For convenience in keeping record and in simplifying calculations, the list price should approximate the price the retail dealer is expected to pay for normal quantities purchased.

STANDARD COST IN TERMS OF FIXED AND VARIABLE COST FOR OPERATING EACH ORGANIZATION UNIT.—To understand the procedure for determining the amount of fixed cost and the per cent variable when making up the master or general budget at the beginning of the budget period, the **functional organization** of the company should be studied. Some of the units in the organization are directly responsible to the chief executive while others are responsible to intermediate executives. For example, the sales or distribution division of the business is organized into a number of units, each having a definite function. One unit is responsible for the sale of products to the jobbers, while another supervises the sales to the company's own branches, and so on down the list. On the basis of volume of business each organization unit sets up a **budget of expenses.** A certain amount of expense in each unit is fixed and goes on regardless of the amount of business done. A portion of the cost varies with the volume of business done. In order to exercise effective control both of these costs should be definitely predetermined according to some measuring unit, so that the chief executive as well as every other subordinate executive will have a standard against which to measure performance. By combining the fixed cost and per cent of variable cost of each organization unit the volume necessary to reach the "profit-point" can be easily determined. This is exceedingly important in connection with the establishment of price policies and methods of distribution. The procedure involves:

1. The setting up of a **minimum and a maximum dollar volume of sales** for the budget period; the minimum volume of business being the smallest amount of sales which there is any reasonable probability of making, while the maximum volume is the practical capacity of the plant, i.e., the amount that can be produced without any extended additions or betterments to the plant.

2. The determination of the **prime fixed cost and the per cent of variable cost** by the use of a formula. The function of the formula is to determine the dividing line between the fixed and the variable cost as previously defined. In other words, it is to show with reasonable accuracy the amount of fixed expense and the per cent variable in each organization unit.

There are four facts to be considered in the formula:

1. The maximum volume of business, represented by A.
2. The minimum volume of business, represented by B.

3. The necessary expense for the maximum volume, represented by C.
4. The expense necessary for the minimum volume, represented by D.

Let X represent the per cent of variable cost, which times the volume of sales plus the prime fixed cost equals the proper cost for the volume of sales budgeted. Let Y equal the prime fixed cost. Working this out by algebra, the formula is derived:

$$X = \frac{C - D}{A - B}$$

Y is the same for each and every volume.

$Y = C - AX$, which should equal the same thing, $Y = D - BX$.

EXPENSE FORMULA ILLUSTRATED.—As an illustration of how the fixed and variable expense is actually determined in any one of the organization units of a particular enterprise, take an organization unit selling commodity A to jobbers. In Fig. 2 is shown a method of determining the fixed and variable cost of one of the sales units in charge of a manager who supervises salesmen who

ORGANIZATION UNIT: Manager Commodity A to Jobbers.

LEDGER ACCOUNT: Manager Commodity A to Jobbers.

SCOPE OF EXPENDITURE: Supervision and Direction of Sales Commodity A.

BASIS MINIMUM SALES AT LIST: $5,600,000. MAXIMUM SALES TO JOBBERS AT LIST: $11,200,000.

STANDARD: FIXED COST PER MONTH: $8,333. VARIABLE COST: 11.50 per cent of SALES AT LIST.

	Cost for Minimum Sales	Cost for Maximum Sales
Jobber's Discount....10%	$560,000	$1,120,000
Bad Debts....0.1%	5,600	11,200
Rebates and Allowances....0.1%	5,600	11,200
1 Manager	8,000	8,000
2 Territorial Supervisors	10,000	10,000
3 Secretaries	5,000	5,000
4–8 Clerks	7,000	14,000
1–2 Boys	500	1,000
7–10 Salesmen	35,000	50,000
Office Supplies—Stores	1,000	1,500
Office Supplies—Special	1,800	2,400
Jobber Sales Literature	24,000	30,500
Postage	2,000	2,500
Telegraph	1,500	2,000
Sales Travel	17,000	21,800
Executive Travel	4,000	4,000
Sales Bonuses	19,000	41,600
Executive Bonuses	13,500	27,000
Miscellaneous	3,500	4,300
	$724,000	$1,368,000

FIG. 2. Organization Unit Selling to Jobbers
(Adapted from chart by J. H. Williams)

sell to jobbers. It should be noted that inasmuch as the company sells through other channels as well, only part of the total sales are considered in this particular selling unit. There are many concerns, however, which sell entirely to jobbers through salesmen who travel away from the home office. Under such organization the sales organization unit selling to jobbers would constitute the entire sales organization, at the head of which would be the general sales manager. However, when the sales organization is divided into different units as in the company illustrated in Fig. 2, the basis for establishing the **operating standards of each sales unit,** i.e., fixed and variable expense, is the minimum and maximum volume expected of each individual unit making up the entire sales organization. For all the other organization units as stated above, the basis of all expense estimates or standards is the minimum and maximum volume of the business as a whole.

Assume that the total minimum and maximum volume of the concern represented is $12,000,000 and $24,000,000 respectively as shown in Fig. 3, and that the minimum and maximum volume of the organization unit selling commodity A to jobbers as shown in Fig. 2 is $5,600,000 and $11,200,000. Assuming that the cost of handling this minimum and maximum volume is $724,000 and $1,368,000, what is the fixed cost and what is the per cent of variable in this organization unit?

According to the formula explained above $\frac{C-D}{A-B}$ = per cent variable. By subtracting the per cent variable from 100% of the business done, the fixed cost is obtained.

A	$11,200,000	*C*	$ 1,368,000
B	5,600,000	*D*	724,000

The difference between the maximum and the minimum volume of sales is $5,600,000, while the difference in the cost of operating the two volumes of business is $644,000. By dividing the difference in the cost for conducting each volume by the variation in sales the result is a variable cost of 11.5% of the sales.

	Sales	Cost
Maximum	$11,200,000	$1,368,000
Minimum	5,600,000	724,000
Difference	$ 5,600,000	$ 644,000

Since the variable cost is 11.5% of the sales price at list, the fixed cost can be determined by taking 11.5% from either minimum or maximum sales, and then deducting it from the total cost as follows:

	Minimum	Maximum
Sales	$5,600,000	$11,200,000
Per cent variable cost	.115	.115
Amount of variable cost	$ 644,000	$ 1,288,000
Total cost as indicated above	$ 724,000	$ 1,368,000
Variable cost	644,000	1,288,000
Fixed cost	$ 80,000	$ 80,000

The fixed cost for the year for this selling unit is $80,000 and dividing this by 12, the average fixed cost per month is found to be $6,666.66, while the variable cost is 11.5% of the volume of sales.

MINIMUM AND MAXIMUM VOLUME OF BUSINESS VS. THE SALES BUDGET.—The maximum and minimum volume of business used as the basis

	Range				Cost Standards		Per Cent Variable

Distribution Cost		2,600,000		4,400,000	800,000	66,666.68	15
TOTAL FOOTINGS	12,000,000	13,200,000	24,000,000	21,600,000	4,800,000	400,000	

FIG. 3. Operating Standards of Organization Units in a Hypothetical Company
(Adapted from a chart in "A Technique for the Chief Executive," by John H. Williams, Bulletin of the Taylor Society.)

for determining cost standards has nothing to do with the sales budget or quota for the ensuing period. Only in the case of a rare coincidence may the amount of the sales budget be the same amount as that represented in either the minimum or the maximum estimates. In the case of the organization unit selling to jobbers, for example, the sales budget may be any amount ranging between the minimum and the maximum estimate (i.e., from $5,600,000 to $11,200,000). The purpose of using two amounts is to determine the amount of fixed cost and the per cent variable in each organization unit for any given budget period. Assuming that these two quantities have been ascertained a measure or standard is *ipso facto* established with which future performance can be compared. Within this range the fixed cost and the per cent variable will remain constant for all practical purposes.

ACCURACY OF THE EXPENSE FORMULA.—It is not assumed that the variable cost as determined by the formula will be absolutely unvarying to the last dollar and cent. The variation will, however, be so slight that it may be disregarded for practical purposes, as absolute accuracy is not necessary for effective control. By examining the accounts appearing in the chart in Fig. 2, it will be found that in a great portion of the items, either the cost as expressed as a percentage of the sales, or the amount expressed in dollars and cents will remain constant regardless of the volume of business done. For example, the amounts of those items like jobbers' discounts, bad debts, rebates and allowances, etc., will vary, but the standard will not. Similarly, the salary of the manager and territorial supervisors are fixed costs, and will be the same for both volumes of business.

There are, however, other salary items in each organization unit which vary with the volume of business from the minimum to the maximum but not in direct ratio to the increase or decrease in sales. The office staff, for example, in the sales branch taking care of the correspondence and clerical functions, requires a minimum number of persons irrespective of the amount of business done. Up to a certain amount of business the help may be able to take care of the work. When the sales increase to a certain amount, the surplus help changes to a shortage and an additional helper is employed. With the additional clerk or stenographer probably an additional $50,000 or $75,000 of business can be done. At the very time the addition is made to the staff, the percentage of the cost expressed in terms of sales will be higher than at the later period when it becomes necessary to add further help to the staff. In a sizable organization unit the various items do not usually shift at the same time. Consequently, in actual practice the cost, as determined in the formula, will virtually remain constant, particularly if the manager in charge of the unit will watch the expenses closely.

FLEXIBLE OPERATING STANDARDS OF A HYPOTHETICAL COMPANY.—In Fig. 3 appear operating standards of all the organization units of a concern based on a minimum and a maximum volume of sales of $12,000,000 and $24,000,000 respectively. The cost of each organization unit has been determined similarly to the sales unit selling commodity to jobbers as outlined above. The total amount of fixed cost for the budget period is, as given in the 5th column, $4,800,000, while the entire variable cost is 70% of the sales. With these two standards established it is obvious that the "profit-point" for this business is $16,000,000. In other words, $16,000,000 of sales will be necessary before any profit will be forthcoming. Every $1 worth of business beyond that amount will yield a net revenue of 30% or $.30 on each dollar. As a means of control this procedure of computing flexible standards has particular merit, for

the cost of operating each department or organization unit of the entire business is computed separately. Having broken down each responsibility into definite units and having established a standard for each unit, the chief executive will be in a position to judge from the reports of each unit just how it is meeting its responsibility. For example, the last two columns in this table give the fixed and the per cent of variable cost of each organization unit based on the sales budget for the period, which may be a year in length as shown in the chart.

In reference to the sales control this method of setting up standards is especially effective. The fixed and per cent variable for the **inventory cost,** which includes total manufacturing cost and the cost of management, it will be noted, is $4,000,000, or 55%. Add to this amount the "general sales overhead and general sales supervision" of both commodities A and B, a basic fixed sales cost of $4,176,000 and a per cent variable of 58%. This includes the general cost of operating the sales organization which includes general advertising, sales promotion, general sales supervision, etc. Regardless of the channel through which the goods are marketed, whether jobbers, dealers, the company's own branches, or an export agency operated by the company, the basic fixed sales cost will be incurred. By recording the sales made through the various channels at list, and all deductions from list, i.e., sales discounts, as selling expense, the relative effectiveness of each method of selling can be definitely appraised.

Function of the Sales Budget

DEFINITION OF SALES QUOTA.—In every industry, there is an **industrial sales quota.** This industrial sales quota for any year is made up of the combined quotas of each individual producer belonging to that particular industry. The aggregate potential sales quota or sales possibilities of any particular industry cannot be definitely determined. It is variable, as its amount depends on the price at which the various products included in the industry are to be sold, and also on the amount each individual business deems proper to spend in sales effort. The industrial quota of any industry will vary from year to year according to general business conditions. Both the price and amount to be spent on sales campaigns will materially affect the amount that can be sold during any particular period.

In reference to the sales budget as it pertains to any individual producer in any industry there are two distinct quotas:

1. The budget sales quota
2. The potential sales quota

The **budget sales quota for an individual enterprise** is the estimated volume of sales expressed in units of products and in dollars which can be produced and financed. In other words, it is the estimated amount of business which the management, according to its policies, deems the most profitable or expedient to attain either for the current year or over a term of years. As one writer on sales quotas puts it: "It is an estimate of the sales, not an abstract calculation of what ought to be, nor what some time in the future may be. Today the sales quota is, in effect, a requisition for a certain volume of production in equal monthly lots."

On the other hand, the **potential sales quota** is the estimated amount of products that can be marketed providing the proper amount of selling expense is incurred. Obviously, the potential sales quota is a variable quantity, since its amount to a large extent depends on the amount of money to be spent for

sales effort. For example, any business can increase its sales by increasing its advertising appropriations and the number of salesmen in the field.

THE COMPANY SALES QUOTA.—The budget sales quota constitutes what is known as the sales budget or sales estimate for a definite cost period. In this discussion it will be called the **company quota.** This is the figure expressing the aggregate amount of business which a company sets up as its goal to achieve during a certain period, and for which production facilities and capital are provided. The company quota is made up of the sales quotas of the various selling units, as sales districts and salesmen's territories, as will be explained later. That is to say, it is the **total expectancy of the sales territories,** i.e., the volume of business each is expected to produce during the ensuing period. The budgeted quota may or may not be scientifically computed; it may just be a rough estimate of the amount of sales the sales manager and other officials of the company think they ought to set up as a goal for the next year.

The **sales records** of a company are the starting point for estimating future sales, since the amount of business during the current year is normally a fair expectancy of what can be secured during the following year. There are, however, various reasons, as will be pointed out later, why other factors must also be considered. A correct estimate of the company quota for any period presupposes a fair knowledge of the relative potential distribution possibilities of the company's products in its several sales districts. The procedure involved in determining it will be given in subsequent pages, while here there will be outlined the functions of quotas in relation to the sales and production activities.

CERTAIN TYPES OF SALES QUOTAS.—There are several types of sales quotas. A familiar form is the **salesman's quota** the chief purpose of which is to stimulate the men to greater effort. Under this plan the salesman usually sets his own sales estimate, and then attempts to attain it; or the sales manager, knowing the individual salesman's characteristics, may adjust the estimate to such a figure as he thinks will cause the salesman to work most effectively. The goal to be attained should be modified to suit the individual salesman's temperament, as some salesmen work most effectively when their goal set is just out of their reach, and others work best when they can show a wide margin of success beyond the task set for them. In some organizations performance is measured against some standard, such as the **potential sales quota.** The record attained by the best salesman or the best sales year is used as the goal and against this actual performance is compared.

These two types of sales quotas are common in many concerns. They are, however, inadequate and unscientific because the sales in any business do not move in a steady, continuous flow, nor even in a straight line of normal growth. There are good years and there are poor years and for that reason sales in excess of the previous years are not always possible. Sales quotas must, therefore, be based on composite factors.

SALES QUOTA IN RELATION TO THE BUSINESS AS A WHOLE.—The importance of the sales quota is usually associated with sales administration, where it is indispensable to efficient management. But its importance does not end there. The sales estimate or quota sets up a goal; it functions not only for the administration of the sales department, but for the entire organization. It is the objective, the goal towards which the entire business moves. On the basis of the predetermined amount of business to be secured, each department can make its plans and determine standards accordingly. The

sales estimate is the foundation of a budget system. By it the fixed expense and the per cent variable for the entire business can be determined.

To secure the best results each division of the business must be properly co-ordinated. Each department must know what the general plans for the budget period are, particularly in reference to the volume of business to be done. For example, the production department needs to know the amount and kind of goods the sales department expects to market in order to have them ready for shipment at the proper time. The personnel department needs to know the predetermined sales volume in order to provide for the proper number of workers. Similarly, the treasurer or other financial officer having charge of the financing of the purchases and other expenses of the business must know very definitely the cost of operating each organization unit so that the proper amount of working capital may be provided.

A carefully planned sales estimate as pointed out previously forms the basis for determining that volume of business which will yield the highest amount of profit on the investment. A certain amount of fixed charges exists in any business and therefore it is highly essential that the sales volume be expanded to such a figure as will yield the greatest amount of net profit. On the basis of the amount of goods which it is estimated can be sold, the **cost of manufacturing and the selling expense** can be predetermined. The difference between the estimated sales values and the factory and selling and administrative costs represents the forecasted profits. With the predetermined amount of sales and costs, the profit can be forecast for each month. Then, by furnishing an analysis of the variations from the estimated profits, by means of reports, the management of the business is in position to take immediate steps to eliminate, if possible, the profit losing conditions.

THE SALES QUOTA IN RELATION TO PRODUCTION.—A budget sales quota which can with reasonable certainty be expected to be realized plays a significant rôle in the production department. The predetermination of a definite amount of sales that can be secured when broken down into monthly or quarterly amounts, furnishes the factory manager a schedule upon which to base initial production plans. It also affords a basis for working out a schedule for the purchasing of raw material. Consequently, the factory is in a better position to lessen the usual seasonal variation in its production rates, and thus it tends to stabilize employment. Furthermore, the raw material and finished goods inventories can also be reduced.

SALES QUOTA A BASIS FOR SALES COMPENSATION.—One of the most important functions of sales quotas is found in connection with **salesmen's compensation plans.** The salesman is not under close supervision and his task is very different from that of the factory worker whose work is more closely supervised and who works mainly with machines. Ordinarily the salesman a large part of his time operates away from home or at district offices. He, therefore, has a much smaller amount of contact with other parts of the sales organization than employees with corresponding responsibilities in the factory have with production officials. Consequently, to get the salesman to work most effectively it is necessary to provide a compensation plan that is based on results. As sales territories vary greatly in sales possibilities the basis of any equitable compensation rests on a carefully compiled sales quota. Selling $20,000 of goods in one territory, for example, may be more difficult than $30,000 in another territory. Regardless of the method of payment, whether it be a commission, salary, or salary and commission or any other combination, the basis is the predetermined sales quota. That is to say, the amount of sales

expressed in units or products or dollars to be sold in each territory during a given period must first be predetermined. This predetermined quota will also serve as a standard of measuring performances.

SALES QUOTA A STANDARD OF PERFORMANCE FOR SALESMEN.— As a means of stimulating salesmen and appraising their performance the sales quota is especially valuable when it is based on fact rather than on opinion; when the salesman knows that it takes into account the conditions peculiar to his particular territory; when he knows that attainment of the goal set in his individual case is of the same difficulty as the attainment of every other salesman in his sales district. A quota which satisfies these requirements not only gives the salesman a definite mark to shoot at, but it also serves as a measure of sales performance against which no excuse can be raised.

To show how the quota may be used as a measuring stick for comparing sales performances, take two salesmen, Smith and Doe, who have definitely bounded territories and whose sales possibilities have been scientifically analyzed. To make the illustration complete, take a company selling three different lines of goods, and assume that the relative possibilities for each of the three lines have been determined; that each salesman's territory has been properly charged with his share for these lines and that the quota of each is a definite amount of business to be secured during the year, apportioned by months.

The quota of each salesman is expressed in "points" of $25 each. A sale of $100, therefore, represents four points. Suppose the following is their record for January:

Smith	220 points
Doe	220 "

Sales territories cannot be alike as to productiveness. Only by strange coincidence would two territories have exactly the same valuation. From the standpoint of measuring sales performance, one of the major purposes in predetermining the sales valuation and setting sales quotas is to ascertain how much business ought to be forthcoming from each territory rather than what each salesman ought to sell based on his past experience. Every territory represents a certain amount of sales opportunity for a concern, and if the salesman does not attain his quota (assuming that he can with proper effort make his quota), he is losing money for his company and should be superseded by some one who can secure the proper territory quota.

Assume that the quota for January was as follows:

January quota for Smith	190 points
January quota for Doe	240 "

The records of the above two salesmen should be placed together on a quantitative basis and their performances compared on a percentage basis:

	Quota	Sales	Per Cent of Sales
Smith	190	220	115
Doe	240	220	92

The real significance of this record is that it shows clearly the true performance of both men. Without quotas their results are on a par; but by means of a quota system, it is clearly demonstrated that Doe's record is better by 23% than that of Smith.

The quota device, as illustrated above, is very important not only as a guide

to the salesman but to the branch or district manager as well. Sales results can be fairly appraised because each salesman's territory has its own measuring stick, so to speak, based on the same known factors. The results of each salesman are indicated on his own scale of possibilities and not on a general average. Without proper standards of predetermined territory-valuation each salesman would be judged by the money value of his sales. The one who sold the largest volume would be considered the most valuable even though he has not done half as well as another man selling in a territory less fertile.

ANALYSIS OF SALESMAN'S RECORD BY LINES OF PRODUCTS.—Under the quota system a salesman's record can be analyzed from another aspect. Since each line has a separate quota, it is possible to analyze Smith's record to see if he has sold a balanced line.

Suppose the following is Smith's January record:

A Line.....	100 points	$2,500
B Line.....	80 "	2,000
C Line.....	40 "	1,000
Total.....	220 "	$5,500

It is not known how well or how poorly Smith did in connection with the individual lines until we compare his January assignments by lines with his sales.

Suppose the January quota points were distributed as follows:

A, 80 points; B, 80 points; C, 30 points; total, 190 points.

By application of his quota his record reads as follows:

	Quota	Sales	Per Cent of Sales Quota
A Line.....	80	100	125
B Line.....	80	80	100
C Line.....	30	40	133
Total.....	190	220	115

It must not be understood, however, from the foregoing illustration that salesmen cannot be judged by one month's sales performance. A salesman must have time to **adjust himself to his territory,** so that he can line up his prospective buyers. This takes time and for this reason **sales records** should by all means be **cumulative,** indicating clearly the performance of several months rather than of a single month, which may be exceptional. A sales executive is interested in knowing the progress of his men from time to time, and for that reason tendency charts should be maintained covering yearly periods. These charts will show plainly the productiveness of salesmen, and they can be so constructed as to indicate the volume as well as the percentages of the quota.

POINT-CONTESTS VS. THE SCIENTIFIC SALES QUOTA.—The foregoing illustrations emphasize clearly the superiority of the scientific quota based on territorial factors over the simple point contests or "games" among sales forces. In point-contests each salesman competes only to prove himself better than his fellows. His superiority is recognized even though he may not exert his own best sales efforts. Quite the contrary is true of the quota plan as pointed out, for each contestant strives toward a standard of possible attainment set on the territory for which he is responsible. His degree of success can be measured by comparing the percentage of the quota that he has attained with the corresponding percentages of his fellow salesmen. In every form of point-contest there should be equal opportunity for all contestants. With this as a

basis the comparison of units may be in any form such as volume in dollars, number of new accounts, or any other unit for evaluating attainments. The predetermined quota for each territory is the starting point.

DISTRIBUTION OF SELLING OVERHEAD ON THE BASIS OF SALES QUOTAS.—As has already been pointed out, sales quotas based on territorial valuation furnish a practical and equitable basis for distributing selling overhead. For the purpose of showing the profitableness of various assignments, it is very important that an equitable apportionment of all the overhead expense be made. By distributing this type of expense on the basis of sales made during the current period rather than on the basis of sales opportunity or sales quota, incorrect conclusions are formed relative to the profitableness of salesmen and territories. While it might be argued that a lean territory should be favored on account of the greater amount of developmental work to be done, the long stretches between customers and other considerations, it is easy to make a mistake in the other direction and charge a profitable territory, branch, or agency with more than its share, thereby making an incorrect showing with respect to the real profit of the organization.

Methods of Determining Sales Quotas

APPROACH TO PROBLEM.—There are **two general methods** for estimating or determining the sales estimate or company quota for the ensuing budget period. These are:

1. Figuring (from the top down) the amount of sales that it is desired to make during the period and distributing or apportioning them to the various selling units, meaning branches, agencies, and salesmen's territories.
2. Figuring (from the bottom up) as to the possible quota of each selling unit and then totalling this up as the figure for the company quota.

In either case the sales estimate must be considered in relation to the productive facilities. Manufacturing capacity must be adequate to turn out the proper amount of goods throughout the year to meet the seasonal demand. However, when a concern can sell more than it can economically manufacture, the problem of determining the quotas of the various selling units is comparatively easy. That is, however, not the case with most industrial enterprises today. There are few companies today which do not have surplus capacity; that is, they can produce much more than they can sell to advantage. The problem of marketing is not what it used to be. Enlarged productive capacity, increased competition, the switch to a buyers' market, and the pronounced tendency to shift the inventory load to the producer's shoulders, make it imperative for manufacturers to give increasingly more attention to selling activities. The problem of preparing a reliable sales estimate based on the relative sales opportunity in each territory or selling unit is complex. To prepare a reliable sales quota based on the relative sales opportunity in each selling unit contemplates a careful study of the concern's sales records and special sales factors as well as general economic conditions. Such a procedure is, however, essential, as the manufacturer must study his market to ascertain not only how much he can sell but where he can market most economically.

There are **two distinct aspects** in connection with the problem of determining sales quotas. The one is concerned with the establishment of the objective, i.e., **the company quota;** the other pertains to the equitable distribution or

apportioning of the total quota to the selling units. Both aspects of the problem contemplate a careful study of the company's sales records by products or classes of goods, by territories, by customers, etc. However, the former aspect of the problem requires in addition to these due consideration to the company's resources and policies, as well as general business conditions as indicated by the forecasting services.

GENERAL SALES FACTORS.—Various methods may be pursued in making up the sales quota. One way is to combine the estimates submitted by the salesmen or the branch managers in case branches are operated. Such a sales estimate is, however, incomplete as it does not take cognizance of such factors as changes in the price level, the business cycle, general industrial conditions, the growth of the company, additional appropriations of funds for sales efforts, etc., since these vitally affect the volume of sales. To make the proper adjustment for each district or salesman's territory, and to give proper consideration to each of the above factors would make the determination of the sales budget extremely complicated. The **better procedure** is to determine, first, the total quota on the basis of past sales and the factors mentioned above, and then apportion the total sales estimate to the various selling units, i.e., to the branches, agencies, and salesmen's territories on the basis of sales opportunity in each.

For example, let the total sales of the preceding year as shown by the sales record be represented by 100%; estimate the per cent of change as produced by the various sales conditions; then add or subtract the per cent of change according to whether it is positive or negative, and a total expressed in per cent for the next year will be obtained. This total multiplied by the volume of the past year's sales gives the total estimate for the following year. The procedure involved will be explained later. The purpose here is to explain general factors underlying the determination of the company quota, while subsequently methods of apportioning the quota to various selling units of a concern will be explained.

THE COMPANY QUOTA.—As an illustration of how the objective of a company is actually formulated by several well known concerns which have planned their sales program very carefully for some time the following quotations are given:

"Our first step toward the establishment of a sales budget for a year is to determine the objective. What is to be the percentage of increase in our sales; what is to be the mark we are to set? General business conditions, past, present and anticipated; our last year's volume and the ease or difficulty with which we attained it; the attitude of the buying public—these are some of the factors we must accommodate when we draw up the equation of the future business. Weighing, analyzing, adding, subtracting, we arrive at a certain net conclusion —the desired percentage of increase. Let us assume that to subdivide and apportion it." ("How Palmolive Budgets Sales," by A. J. Lutterbach, Comptroller of Palmolive Co., *Sales Management*, July 1922.)

Another concern which has given careful consideration to the problem of setting sales quotas scientifically for several decades uses in the main the same procedure as indicated in the following quotation from a letter of one of the executives of the sales department:

"Our method very briefly is to first establish a figure for the year representing the total amount of business in dollars that we can reasonably expect to secure in that year, taking into consideration the sales volume secured in previous years, business conditions and other factors, among which is included the

capacity for machine production in various branches of our factory. After setting this figure representing the gross volume of business to be secured we distribute it among our agencies on the basis of two factors, the first being the number of business enterprises in the territory; second, the number of machines already in use."

AMOUNT OF THE SALES QUOTA.—On account of changes in market conditions, seasonal fluctuations, policies of the company as well as inadequate statistics relative to past sales of the industry, it is not possible to make a sales quota mathematically accurate. In other words, it is hard to determine in advance what percentage of the past sales volume the quota for the ensuing period should be. Should it be an increase or decrease over the previous year, and how much? There seems to be a difference of opinion as to whether or not the sales quota should be above or below an attainable goal. It may be an amount of business that the company confidently expects or hopes to sell, or it may be arbitrarily placed above or below that figure. If placed above, it is on the theory that the higher the aim, the greater the results are likely to be. At the same time the company should not handicap itself by setting a mark which only a part of the sales force can reach. If it is placed below, it is because the quota is regarded as a minimum to be exceeded so far as possible. On this point C. P. Staubach, a leading advocate of the sales quota idea, and formerly General Sales Manager of Burroughs Adding Machine Co., says:

"Perhaps the best basis is a quota beyond the previous year's results but below the current year's expectancy. When men know that this is the basis, they realize that the company quota is a minimum; that it is not unreasonably above the previous year's actual results, and that they have every chance to make better than quota. Every man likes to reach and then exceed a 100% estimate of his powers and possibilities. No one wants to feel that quota can be reached only by terrific effort or unusually favorable conditions. A fair distribution is of utmost importance."

Even though no definite formula by means of which the total amount of business a company can do can be definitely determined, the sales estimate should not be guessed at. The general considerations which should form the basis for the preparation of this estimate may be put under the following general headings:

1. Past performance
2. Probable business conditions
3. Secular growth of sales
4. General plans and policies of the concern

PAST PERFORMANCE.—The starting point in making a sales estimate in any concern is past performance. By this is meant the volume of business it did in the past, particularly in the year just closed. This is the point of departure for estimating future sales. Complete sales records are indispensable as a basis for making forecasts for the next year. Every company normally increases its sales from one year to another. However, the amount of business to be budgeted in any particular year must be determined with great care in the light of conditions prevailing at the time.

PROBABLE BUSINESS CONDITIONS.—In the process of setting up a quota for the business as a whole the first general problem is to determine the **probable course of the business cycle** for the next year. A study of the concern's past sales records over a period of years will indicate the secular trend or normal growth of the concern. By normal growth is meant the increase of each year over the previous year. But unfortunately, external conditions are rarely

normal. One of the fundamental characteristics of present-day industrial organization is the cyclical movement of business activities, the alternative periods of depression and prosperity. Not only is there a general business cycle but **each industry has its own cycles.** Every business should, therefore, study carefully its past sales extending over a period of years to determine its cycles and see if they correspond in point of time with the cycles of general business. Such a study would no doubt prove fruitful, as not a few concerns in the last few years have suffered great losses through failure to anticipate a declining market. For example, if production is increased in anticipation of an increase in sales volume and a depression suddenly sets in, inventories accumulate beyond current needs. The excessive stocks must then be sold at a reduced price and a consequent loss to the business. In case the management fails to sense a rising market, the result is just the opposite. Under such conditions sales are underestimated, production is curtailed and as a result, profits are not realized.

CHANGE IN PRICE LEVEL.—In establishing a sales quota due consideration should be given to the probable course of prices. This is particularly important in times of violent changes in the price level, when prices are either rapidly moving upward, as in times of great industrial activity or declining when a depression sets in. In a time of rising prices due allowance should be made in setting up the sales quota, for the same number of units as sold in the preceding year will bring a greater amount of money. In the case of products for which the demand is relatively constant and inelastic, a considerable portion of the total sales constitute a change in the price level.

Index numbers reported by such agencies as Dun's, Bradstreet's, and the Bureau of Labor Statistics will show the change in prices from time to time. A change in price level is also revealed by bank clearings outside of New York City. By comparing the average clearings of the year just closed with the preceding year, the per cent of increase or decrease in price level can be ascertained. If, for instance, the bank clearings outside of New York City for the year just closed have increased 10% over the year previous, it is evident that a change in price level has taken place because bank clearings increase when prices rise.

SECULAR GROWTH OF SALES.—In addition to the price influence it is desirable to consider the secular trend or growth which the business normally experiences. Many established businesses, taken over a period of years, have a fairly constant rate of increase in sales from one year to another. In other words, in most companies there is a certain percentage of increase in sales volume which comes as a result of increase in population and general industrial development, and of general good-will established. This **normal rate of growth** can be computed by a statistical process in terms of dollars which in turn can be reduced to a definite per cent.

CHANGES IN GENERAL PLANS AND POLICIES.—Another important consideration in establishing a sales quota is concerned with the general plans and policies of a concern. In many businesses there is a special department called by various names, such as sales engineering, sales promotion, sales development, or sales research department, whose function it is to study sales possibilities and to recommend changes in sales policies and methods. As a result of such recommendations new lines may be added; old lines may be dropped; new territories may be entered; new agencies or branches established; new methods of distribution put into effect; changes in prices or terms of sales made; additional advertising carried on; more salesmen added; and numerous

changes made. If additional advertising is provided for, the total volume of business will be increased. The effect in terms of sales should be carefully considered.

SUMMARY.—When all the percentage changes of the factors discussed above have been determined in relation to the volume of the past year which is taken as the basis, the quota for the following year can be computed. An illustration of the procedure would be as follows:

Suppose that the last year's volume of a concern was $10,000,000 and the estimated percentage of increase as represented by the factors as explained above is as follows:

1. Probable changes in business conditions and price level	5%
2. Secular growth of sales	2%
3. General plans and policies	3%
Total increase	10%

The quota for the next year would be 110% of past sales, $10,000,000, or $11,000,000.

It is not intended that the foregoing factors for estimating the total volume of business be regarded in any way as final. They are only the general factors as affecting every business. In addition to these, every individual enterprise has other specific considerations pertaining to the channels of consumption of its particular product which need to be recognized. For example, a manufacturer of products consumed in new buildings, by railroads, and in the oil industry, would need to consider the state of business activity in each of these industries and to determine the percentage of increase or decrease to be expected from each during the next year.

FORM OF SALES QUOTA.—The terms in which the sales quota is to be expressed depend upon the type of business and the purpose for which the quota is to be used. In the past, when sales production and expenses were budgeted in a more or less informal way primarily for the purpose of financial control, the expression of the anticipated sales in terms of value was adequate. For the purpose of financial control all estimates must be translated into dollars and cents; but for the purpose of sales administration and effective co-ordination of sales, production, and purchases, estimates must be expressed in the form of physical quantities and not in terms of value only. There are possibly a few concerns which can effect sales and purchase control in terms of value, but these cases are rare.

More adequate control can be secured when sales are expressed in physical units, such as pieces, pounds, yards, etc., indicating geographical distribution, because the activities of the production department are in terms of items and not in terms of dollars and cents. The production department cannot make up its departmental budget if the total sales quota is, for instance, expressed in one grand total of dollars for the budget period. The production manager should know the number of the various types of products and items that are to be produced.

IMPORTANCE OF SALES PLANNING IN TERMS OF ITEMS.—There are several reasons for setting up sales quotas in terms of items or classes of products. In the first place, orders for goods are in terms of individual units of products. It is possible to have a large inventory and yet not to be able to fill certain orders if the particular classes of items called for are not available. In the case of goods which are subject to style changes it is of course impossible to determine very accurately the quantity of all the items needed. Nevertheless, past sales records will indicate fairly well what the demand has been by various

customers for different items. In some organizations the preparation of sales quotas by items is very complex. The number of items handled may run into thousands. Under such conditions it is a difficult problem to estimate sales and plan production in terms of individual items. There is no doubt that in some instances the number of items is so large that this procedure would be impracticable. A careful study of the sales records by items will usually show that the bulk of sales are made from a comparatively few items. Where this is the case, a list of the rapid-moving items will probably constitute the greater part of the sales.

In the second place, as has already been pointed out, sales quotas should be studied in relation to items or classes of products so as to produce the **best aggregate result in terms of net profit.** If the margin of profit by items of merchandise or groups is indicated, the setting up of quotas in terms of items for salesmen will be expedited. This will not only help to construct a budget which will yield the greatest aggregate return, but it will also serve as a guide in sales administration. When the sales manager knows the margin of profit of the various products, he is in a better position to formulate policies with regard to discounts, and size of orders. This is especially true in connection with contract sales. Sales compensation plans can be devised so as to reward salesmen in accordance with the amount of profit they produce rather than with the volume of sales they make.

MONTHLY SALES QUOTAS.—The company quota will be more effective when broken down into monthly or quarterly amounts. This makes for **closer co-ordination between sales and production** and thus reduces the inventory to be carried. Monthly sales quotas serve also as a means of controlling selling units. If definite amounts are to be sold each month, there is a tendency on the part of salesmen to apply themselves more uniformly throughout the season or year than if their work is checked up every six months or at the end of the year.

Monthly sales quotas can be set up by determining the percentage contribution of each month to the total sales. This percentage figure, for example, for the month of January can be derived by adding all January sales, and by them obtaining an average figure (four years) by dividing by four. If the amount thus obtained is divided by the average sales for the four years, the normal percentage weight of January sales can be determined. In a similar way the amounts for the other months of the year can be ascertained. Then, by applying the percentages thus obtained to the estimated quota for the ensuing year the per cent of the total sales for each month of the year can be established.

QUARTERLY QUOTAS.—Instead of setting quotas for a year, concerns sometimes put them on a quarterly basis. In the first place, when the attainment of the quota is a year away, the incentive during the first part of the year would seem to be less than during the latter part when the branch offices or salesmen are approaching the goals set for them. If quotas are set for only three months in advance, the incentive which the quota furnishes is distributed throughout the year. In the second place, it is highly important that **quotas conform to prevailing business conditions** throughout the entire country. In entering a general wave of prosperity the quota should be higher than when entering a wave of depression. The accuracy with which business conditions may be predicted will depend upon the length of the period covered. Forecasts can be made with much more certainty for a period of three months than for a year. In setting quotas for a quarter only, it is necessary that careful consideration be given to the **regular seasonal fluctuation in the different branch**

offices throughout the country. These will vary in different sections. In order to get an accurate measure of the seasonal differences a study should be made of the volume of business of each period over a number of years. This can be done by following the procedure described above for establishing monthly sales quotas.

PROCEDURE OF APPORTIONING THE QUOTA TO THE SALES UNITS.—With the company quota set, the problem becomes one of distribution. In other words, the next thing to be determined is the share of the whole quota each part of the company, agencies, branches, and salesmen is to carry. This should be done primarily on the basis of **territory valuation** as will be explained in subsequent pages. In order to facilitate the comparison of sales figures it may be desirable to establish what is known as a **"sales point."** As the products in most concerns are varied, consisting of various items grouped by classes, the administration of the sales quota is very much facilitated by expressing sales in points. To illustrate, the National Cash Register Company, one of the first companies which successfully used the quota device in its sales organization, originally estimated the number of registers to be sold in its various territories on the basis of one register to each 400 population. As its registers were improved, different types of machines, varying in prices to suit the convenience of different businesses, were built. Consequently the number of registers sold was abandoned as an objective and a **point system** in which a point represented $25 of sales was adopted.

Other progressive companies operating on a quota system are also using some form of point system. The value of a sales point is not an arbitrary figure. The amount of sales expressed by a point should vary to suit the conditions of the individual business. It will depend somewhat on the type of goods sold. When the average size of the order is around $10, it is practical to have a point that will constitute sales of that amount. The amount to be sold by each branch should then be stated both in dollars and points as given in the table below.

Sales Units	Sales in Dollars	Sales in Points
Boston Branch.....	4,059,862	405,486
New York Branch.....	5,786,500	578,650
Philadelphia Branch.....	2,132,580	213,258
.....	.....	.....
.....	.....	.....
.....	.....	.....
Sales Quota for 19—.....	.....	.....

POINT SYSTEM FOR EACH GROUP OR CLASSES OF PRODUCTS.—When a number of items are carried, the amount to be sold of each should be expressed in points. The advantage of "point" quotas can be demonstrated by the use of the following hypothetical table, indicating record of sales performance of a selling unit.

Sales by Groups of Products

Group	Quota Points	Sales	Per Cent of Sales Quota
A	80	100	125
B	80	80	100
C	30	40	133

When sales quotas and actual performances are expressed in this form, the work of salesmen, agencies and branches with reference to sales can be readily appraised. According to the sales points it would seem that group "C" was neglected, but when compared with the quota, it will be seen that its sales represent the highest per cent of the assigned quota. By assigning larger quotas in those groups which the concern wishes to push, the salesman will be impressed by the need for additional sales effort.

The salesmen, however, should not be expected to put forth additional sales effort unless the management provides them with the **necessary** incentives. In order to elicit a higher degree of selling effort, some sort of **bonus or commission plan for paying salesmen** for sales in excess of quota should be adopted. The attainment of the assigned sales quota will constitute 100% efficiency.

MONTHLY QUOTAS FOR BRANCH SALES MANAGER.—Monthly quotas should also be set up for each branch in the manner indicated above, and the sales performance may be recorded as shown in the following table.

Month	Quota Points	Points Sold	%	Previous Year
January				
February				
March				
April				

In the first column is entered the estimated quota in sales points for each month, as previously determined. The second column shows the actual sales results achieved, entered monthly after the figures for the month are compiled. This is the "proof of the pudding," as it indicates whether the quota was properly estimated in relation to the possibilities for the given period. The third column, showing the per cent attained in the month compared with the estimate, is very significant, since the percentages of achievement are much more graphic than are totals in dollars, cents, or units.

Apportioning Company Quota

THE PROBLEM OF QUOTA SETTING.—In the preceding pages, only the more general factors which pertain to every business have been explained. In every industry there are certain other special factors that should be considered in connection with the company quota. Regardless of whether the company quota is established by figuring "from the top down" as outlined, or from the "bottom up," the **problem of apportioning the estimate to the salesmen** according to sales opportunity arises. The volume of business a concern desires to do changes from year to year, and normally there should be a certain amount of increase in physical units even if the price level rises. The **general practice of most concerns** is to set their sales estimate for the coming year a little above that of the preceding year. Such a policy leads to sharp competition among companies and especially among those in the same industry.

Assuming that the increase in sales, whatever the amount may be, has been settled by the management, the next problem the sales division has to solve is to determine what proportion of the increase each branch, agency (if agencies are operated), or salesman's territory should bear. To make the apportionment in an equitable way contemplates territory valuation. To do

this properly it is necessary to ascertain the comparative sales opportunity of the various sales territories.

PROBLEM OF TERRITORY VALUATION.—The factors affecting the sales of different products are many. No general formula for measuring the sales possibilities can be devised which is applicable to all businesses. A procedure which is practicable in one organization, may be applied in another concern which sells different commodities. Every business, to some extent, is different from any other business. Notwithstanding this, as one writer says: "While it is true that quota plans are not of the ready-to-wear variety, and that seldom, indeed, can you find a plan used by one concern that will lend itself to your needs, still the fundamentals of quota-fixing are much the same." In other words, there are certain **fundamental principles of procedure** of territory valuation and sales quota fixing which are applicable to all businesses.

PRINCIPAL FACTORS IN SETTING SALES QUOTAS.—As a basis for setting quotas, various factors are used by different organizations in various industries. The **most common single factors** used are the following:

1. Past performance, shipments of previous year plus a certain per cent of increase.
2. Population.
3. Per capita statistics.
4. What salesmen think they can produce.

There is a tendency, however, on the part of the more progressive concerns to use several factors as a basis for setting sales quotas.

PAST PERFORMANCE.—The **traditional method** of computing sales quotas as followed probably by a vast majority of concerns is based almost entirely on past sales. Not infrequently, the sales estimate is a purely arbitrary figure representing the opinion of some home office official as to what the volume of sales should be made in the various territories. The **usual procedure** is to increase the company quota for the following year by a certain arbitrary per cent over the previous year's sales and then apportion the total quota to the selling units on the basis of their past sales.

Suppose a concern did $10,000,000 worth of business in 1924, and it sells its products through its four wholesale branches, whose sales are as follows:

Branch A	$ 1,500,000
Branch B	2,000,000
Branch C	3,000,000
Branch D	3,500,000
Total	$10,000,000

If for the year 1925 the company plans for a 5% increase or $500,000 more business than in 1924 the total quota will be $10,500,000, and on the basis of past sales will be apportioned to the branches as follows:

Branch A	15% × $10,500,000	$ 1,575,000
Branch B	20% × $10,500,000	2,100,000
Branch C	30% × $10,500,000	3,150,000
Branch D	35% × $10,500,000	3,675,000
	100%	$10,500,000

Within each branch the increase is similarly apportioned over the salesmen's territories.

Obviously, sales quotas distributed in this manner will not stimulate much enthusiasm in the branch manager, as he will not be inclined to take the sales estimates made in this way very seriously. Should his performance fall far

from the mark, either below or in excess, he will simply regard it as a bad "guess" on the part of the home office official. If some of the other branch managers in the organization far excel him in quota attainment, he will regard the difference as due to the standard set in each case rather than to difference in managerial efficiency. The **maximum value of a quota** can be attained only when the branch manager knows that it is based on the fundamental economic conditions of his territory and that attainment of the goal set in his individual case is of the same difficulty as that for every other branch manager in the organization. When a quota is established on a scientific basis and satisfies these requirements, it can be used as a standard for measuring managerial success.

LIMITATION OF PAST PERFORMANCE AS A BASIS FOR SALES QUOTAS.—Notwithstanding, past sales is a very important factor in estimating the amount of business for the following period, and should be given careful consideration. In fact, it is the starting point for sales budgeting. Proper records will show what the sales have been in each territory by products, customers, etc., and will also indicate the amount sold by weeks and months throughout the season and year. However, the exclusive use of the past sales factor as a basis for determining sales quotas is unscientific and usually inaccurate. In the first place, it does not take into account trade conditions, changes in price level, as previously explained. For instance, if the price level is, say, 5% higher at the time the sales quota is determined than it was during the previous year, and if the rise promises to continue throughout the following year, the sales volume expressed in dollars will be at least 5% more without increasing the physical volume. Expressed concretely, if a concern's sales have been, say, $20,000,000, it will have to do at least $21,000,000 of business to equal the previous year's record in terms of physical units. Conversely, in case prices are on a decline more units will have to be marketed in order to equal the previous year's amount of sales expressed in dollars. Both from the viewpoint of sales administration, particularly in reference to paying salesmen, and in the co-ordination of sales with production the change in price level, if it affects the prices of the company in question, is a very important factor. The production and sales managers usually have different viewpoints regarding the quota. The former is inclined to figure in physical units, while the latter estimates sales in dollars and cents.

Secondly, such a method does not take cognizance of changes in market policies on the part of the business, and such changes are effected from time to time in most companies. For example, advertising activities may be increased, the territories may be cut down, and more salesmen employed, and consequently the sales will be increased.

In the third place, the use of the past sales factor exclusively as a basis for apportioning sales quotas presupposes model salesmen and that the products have been evenly distributed throughout each sales district in accordance with sales opportunities. In other words, this procedure does not take cognizance of the fact that some sections are closer to the saturation point than others, and therefore, cannot absorb the increase as readily as other territories less developed. The distribution of the sales increase each year on the basis of past performance does not take this factor into account. By apportioning the increase of the anticipated sales budget according to past performance there is a tendency to reward salesmen who have previously loafed on the job and who have not worked their territory as much as they might have done. Their quota will as a result be much lower than it should be. Then, if salesmen are awarded a bonus in addition to their salary, as is commonly done, according to the per cent of the quota they attain, much dissatisfaction results.

SALES RESEARCH IN RELATION TO PAST SALES FACTOR.—The importance of the past sales factor as an index of possibilities or relative sales opportunities in the several sales districts and territories will depend upon the length of the time a concern has been in business and the amount of sales research it carried on for the purpose of developing its market. A concern which has been in operation for two or three years cannot place nearly as much reliance on past performance as a company that has been distributing products for several decades. Especially is the past sales factor a good index of sales opportunity for **an older concern** which has supplemented its past performances with careful sales research. In other words, enterprises which have made a study of factors which affect the sales for their product and have apportioned their company sales quota to each district and territory accordingly will have stimulated sales development in all territories.

An illustration of this type is the National Cash Register Company, which has been operating on the sales quota system for over 30 years and has developed its territories so well that today it can place a great deal of emphasis on the average business secured from the past five years in any of its territories. Through intensive analysis of the factors this concern has developed its sales districts to such an extent that it knows approximately what each should produce. Thus, each year its "past performance" factor becomes stronger as a measure for predicting sales.

POPULATION.—A common type of basis for sales quotas is population. This sales factor, however, has serious limitations in indicating sales opportunity. When used by itself, population is very **inadequate as a basis for estimating or apportioning the company quota,** because only very few concerns, if any, produce commodities for which equal per capita sales may be expected in all sections of the market, provided the market is more than local in scope. To illustrate, a high-grade residential suburb of 15,000 population is far better market for davenports retailing at $350 than a mill town with ten times that number of persons. Conversely, the mill town will unquestionably prove a far better market for chewing tobacco per capita than the exclusive residential suburb of 15,000. In each sales district of every concern there are various classes of consumers having widely different tastes and desires and the relative proportion of these consumers to total population varies in different sections of the country.

Again, the inadequacy of population statistics as a basis for setting sales quotas is to be seen in the **different activities of cities** of the same population. Some cities are distinctly jobbing centers. By virtue of their geographical location and commercial development they are distributing points rather than retail outlets. More wholesale distributors are found per thousand population in some cities than in others. Accordingly, the sales of branded merchandise in such jobbing centers should be decidedly greater than in other cities which lie in the non-jobbing zones, where jobbing is more of a name for local distribution from jobbers to retailers, rather than distribution over several hundreds of miles of territory.

WHAT SALESMEN THINK THEY CAN PRODUCE.—Some concerns set up quotas on the basis of what their salesmen think they can sell. This method would seem to be impractical for an aggressive enterprise. In the first place, a salesman who is engaged only in selling is not in as good a position to get the perspective of the sales opportunities as the sales manager who has at his command the salesman's reports and estimates based on other factors. Then, too, salesmen who travel territories for several years usually get fixed ideas

concerning the volume of business that it is possible to obtain in the territory. Not infrequently salesmen develop their territories by making the retailers their own customers rather than customers of their concern. They call on "pet" accounts, i.e., dealers whom they can sell with least possible effort, and neglect many other prospective customers who might be sold with the making of an additional effort.

WEALTH STATISTICS.—Too much attention may also be attached to wealth statistics in undertaking an analysis of the sales possibilities of an article sold over a wide area, and for which a market index can be determined only with difficulty. As a rule, wealth statistics **taken alone** are **not reliable** in determining potential distribution possibilities. In the first place, it is practically impossible to get reliable wealth statistics, and secondly even though such figures were available, they would give but a slight clue as to the probable demand for any particular commodity. Published wealth statistics are commonly reduced to a per capita basis, but a **per capita wealth figure is of little value** for estimating potential sales for it does not indicate the distribution of wealth. For the sale of most manufactured products it makes a great deal of difference whether the wealth in a community is fairly evenly distributed or highly concentrated in the hands of a few people. For example, 90% of the income in certain sections may be received by less than 20% of the population. For certain very high-priced commodities such a distribution of wealth may be an index of great sales opportunity; for most articles of consumption a more even distribution of capital would be far more desirable from the viewpoint of making sales.

CONCLUSION ON PAST PERFORMANCE, POPULATION, WEALTH STATISTICS.—It must not be understood from the foregoing discussion that population and wealth statistics or income are not important factors in determining market possibilities. They are **significant sales factors when properly used along with other factors.** The purpose of discussing them here is to call attention to the limitation of these factors and to point out the danger of placing too much weight on any one of them. In order to sell most economically a concern should know, first of all, the per cent of its total distribution possibilities that each of its sales territories represents. It is not likely, as stated before, that the actual sales as shown by the sales records of a firm are in exact ratio to the possibilities in every section. Some territories will show greater opportunities for sales development than others. It is, therefore, important that every effort be made to ascertain the relative sales opportunities of each sales district included in the selling area.

COMPOSITE FACTORS.—The **more scientific plan** of apportioning sales quotas to selling units contemplates the consideration of several factors in conjunction with past performances. The nature of these factors will depend upon the type of product sold, whether, for instance, it is a commodity that is used by every person, such as shoes, groceries, etc., or one that has a specialized use, such as automobile tires, steam shovels, soda fountains, etc. Every concern will have to determine what the particular sales factors of its product are.

In setting sales quotas for the sales force of any company, the first step is to determine who its **customer units** are, and where they live; in other words, who are its potential consumers as well as its actual purchasers. This is a relatively easy problem in connection with some products and a very complex one in others. The manufacturer of office appliances will find his potential purchasers limited to business enterprises, schools and colleges, etc. The number and the

location of the potential purchasers of this type of goods is relatively small and can easily be secured for each state and county. The same applies to producers of equipment and material which is sold to manufacturers. The soda fountain manufacturer will find his potential buyers among business enterprises. Other illustrations could be given to show that some products have a limited and well defined market. On the other hand, in the case of certain food products, which are more or less consumed by every person, the entire population of a community must be considered. For many other types of products the number of people between certain ages are potential purchasers.

Again, in analyzing the market for some types of commodities conditions other than those of a strictly personal nature need to be considered. The selling of electrical appliances is a case in point. Sales opportunities for this type of goods will depend to a large extent upon the percentage of wired homes in various sections of the country. For example, a manufacturer of certain electric equipment, in analyzing his market, found in one city of 300,000 population about 25,000 families supplied with electric current. In that city there were virtually 25,000 possible buyers. However, in another city having about the same number of people only about 3,000 households were equipped with electricity. Consequently the market in the second city was very much smaller.

It should be obvious from the above discussion and the illustrations that while there are some commodities which are consumed by the general population, the market for many other products is more or less limited to a restricted class of consumers which have to be appealed to and solicited. The particular sales factors will, therefore, vary with different industries. When two or more factors are used, the final quota figure is secured by giving each factor a value in accordance with the accuracy with which the factor reflects sales possibilities. The value is applied to each result. The procedure involved in estimating sales quotas when several factors are used is well demonstrated by two well known concerns, the Burroughs Adding Machine Company and the Detroit Steel Products Company.

HOW BURROUGHS ADDING MACHINE COMPANY APPORTIONS SALES QUOTAS ON BASIS OF COMPOSITE FACTORS.—The Burroughs Adding Machine Company manufactures adding machines of various types which it sells direct to business enterprises through its salesmen. This concern apportions its total company sales quota among its agencies **on the basis of two factors:** (1) the **number of business enterprises** in the sales territory, (2) the **number of machines already in use.** The agency quota is distributed among its sales territories on the same basis. This concern has found from a study of its sales records in all parts of its sales districts that the number of their own machines in use in any community is a fair index of sales opportunity in that place. A locality which has 100 of their machines in use is a better market than another which has only half that number. The Burroughs Adding Machine Co. has a complete record of the sales made in each county in every state. This constitutes one of the basic sales factors used in estimating the sales opportunity in each county.

The other factor is the number of business enterprises. Included under this heading are businesses of all types—banks, public utilities and schools, colleges, etc. All these institutions are studied and classified in various ways. "A Business Enterprise Count," published by the R. L. Polk Co., is used as a basis for the classification. The R. L. Polk Co. has grouped all businesses under eight major classifications as follows:

Manufacturers	Banks
Wholesalers	Financial
Retailers	Public Service
General	Government

The major groups are subdivided into more detailed classifications, numbering over one hundred different lines of trade in all. For instance, manufacturers are divided into 27 divisions as to kinds of business as follows:

1. Agricultural Machinery and Implements
2. Automobiles: Auto Supplies and Accessories
3. Boots: Shoes and Leather Goods
4. Cigars and Tobacco
5. Clothing and Dry Goods

Etc.

Subdivisions are similarly made of the other major groups.

All concerns except banks are divided into four groups according to rating as given below:

1. Those rated at $35,000 and over.
2. Those rated from $5,000 to $35,000.
3. Those rated less than $5,000.
4. Those not rated.

The banks are divided into groups according to volume of deposits.

1. All banks having deposits of over $5,000,000.
2. All banks having deposits of over $1,000,000 to $5,000,000.
3. All banks having deposits of over $400,000 to $1,000,000.
4. All banks having deposits of less than $400,000.

For every county in the United States the Burroughs Adding Machine Co. has a valuation sheet in which the number of businesses are classified as follows: financial, government (United States, state, county, city, etc.), public service, manufacturers, wholesalers, department stores, general stores, garages, other retailers, general. A definite **sales value** has been worked out for each class of enterprise according to its rating. By placing a fixed valuation, for illustration, on a wholesaler rated above $25,000 as against a wholesaler rated below $10,000, or a department store rated between $10,000 and $25,000, and a manufacturer rated between $5,000 and $15,000, a good estimate can be made of the value of each potential market. A value is set on every business. Banks carry the highest valuation, while barber shops carry the lowest.

After a number of businesses in all the lines with their sales valuation is known, it is only a matter of multiplication and addition to compute the sales valuation of each. The territory valuation and quota computed on the basis of the number of enterprises is divided by two. The total quota based on the number of machines in use is also divided by two. Half of the total of the quota computed from each factor, viz., the business enterprise and the machines in use, is added and the sum of the two form the quota.

A concrete illustration of the way the "past" sales and the business enterprise factor may be applied is as follows:

Suppose that the machines in use in Delaware County represent 1,000 quota points and the machines in use for the entire country represent 100,000 quota points. This shows that Delaware County has in the past absorbed 1% of the company's output, i.e., 1% of the machines have been sold in Delaware County. The estimated production for the next year, is, say, 35,000 quota points. If Delaware County sells the same proportion of the total machines as it did in the

past, its quota should be 350 points, plus a certain number of points for increase in business. It is evident that based on figures of past performance there should be no reason why a salesman could not sell 350 points in Delaware County during the next year.

Suppose the business enterprise valuation as discussed above would give a quota of 380 points. If each factor, i.e., past sales or product in use, and business enterprises, is given equal weight, each would be discounted by 50% and the result would be as follows:

Past sales or product in use.....	50% of 350 points =	175 points
Business enterprises.....	50% of 380 points =	190 "
Delaware County quota.....		365 "

Each factor will serve as a check on the other. If one of the quotas is slightly out of line, it will be corrected by the other. If a certain county in the past, for instance, has not been producing as much business as it should, its quota based on past performance will be relatively low, but it will be brought up to a fair valuation by the quota arrived at from the count of business enterprises.

DETROIT STEEL COMPANY'S METHOD.—Another concern setting its quotas on the basis of territory possibilities instead of past performances is the Detroit Steel Products Co. As this company manufactures a building material product adapted for various types of industrial buildings, the sales factors are different from those of the adding machine manufacturer. As before stated, the sales factors to be used as a basis for territory valuation and sales quotas vary with the lines of business. While the business enterprise factor is important in determining sales possibilities for some lines of products, in other industries it may be entirely disregarded.

The Detroit Steel Products Co. used the following five factors in establishing a sales quota for each territory.

1. Population.....	20 points
2. Number of architects, engineers and contractors.....	25 "
3. Number of industries rated over $10,000.....	25 "
4. Average of three previous years estimates.....	20 "
5. Average of three previous years orders.....	10 "

An index of 100 points was used to cover all the factors. These points were divided among the factors in proportion to the importance the manufacturer felt that each played in determining the possibilities as indicated above.

The procedure as applied to a given territory is as follows: First, the population of the territory is divided by the total population of the United States and the resultant per cent is multiplied by the 20 index points. This gives the number of index points for population. Second, the number of architects and engineers and contractors in the territory is divided by the entire number in the United States, and this per cent is multiplied by 25. In the same manner, the procedure is carried out with all the other factors, and for all the territories. The points for the entire number of sales territories is added together to get the total index points for the country.

The company quota is set up as a certain goal which expresses the amount of business which the officials think they can attain during the ensuing budget period. This amount is represented by the total index points in the United States, as established by the procedure explained above. The share of the whole quota each part of the company, the territory, or agency is to carry, is established by computing the per cent of all the index points in the United States in

each territory or agency. This per cent is then multiplied by the total quota, which is expressed in dollars.

DETERMINATION OF POTENTIAL DISTRIBUTION DIFFICULT.—The purpose of the foregoing illustrations is to show how several sales factors may be used effectively for apportioning sales quotas to selling units. It will be noted that the products of these concerns have a somewhat specialized market, and the potential sales possibilities are probably easier to determine than other businesses which make goods for which there is a **general market.** In determining relative sales opportunity or distribution possibilities for this type of products a more complex problem is encountered. As an example, there are certain kinds of food products which everybody consumes more or less, such as Heinz's products, coffee, sugar, etc. Other examples are general household goods. How shall a manufacturer and distributor of this type of goods determine what portion of his sales quota should be sold in each section of his selling area? On account of the lack of proper sales statistics, the determination of the potential demand for many commodities, particularly those for which there is a general market, is very difficult.

While the census figures show the total production of the general types of commodities, they do not indicate where they are sold and consumed. A manufacturer, for instance, may find that in the past year the total production of the commodity of the industry of which his business is a part was $100,000,000, of which he produced $5,000,000 or 5%. But he cannot determine from the total figure where the commodity was marketed. Were it possible for a concern to obtain the annual total sales of the line it produces for each state, either in physical units or in money value, the problem of establishing scientific sales quotas would be very much lessened. Each concern could then estimate:

1. What per cent of the total production it produced.
2. What per cent of the total production was sold in each state.
3. What per cent of the total business it (the individual concern) did in each state and thus determine if it is receiving its proper share of the business done.

It is possible that sales information of this type will some time be made available through trade associations of the various industries. There is a strong tendency in that direction now. In the **life insurance business** it has been demonstrated how sales statistics along the line mentioned above may be made available. Within the last few years the large life insurance companies controlling somewhere around 80% of the business, have **pooled** from time to time the amount of insurance each company has written during the year and also the amount of insurance it has in force. Their problem of predicting the amount of insurance sales quotas each year for insurance companies is, therefore, very much simplified. The **automobile tire manufacturers** can approximately arrive at the total annual consumption of tires by securing the total registration of motor vehicles from each state. However, for most lines an "industry quota" is extremely difficult to determine, and consequently other methods of solving the problem of territory valuation have to be adopted.

SALES QUOTAS FOR PRODUCTS HAVING A GENERAL MARKET.—Generally speaking, a manufacturer who makes a product taken by the public and distributed nationally will find a number of factors throughout the country in the various communities which affect its demand. This is particularly true of **direct goods for personal consumption** rather than for the indirect goods of the more durable type. Take, for example, such elements as education, religion,

climate, superstition, as well as many others—all these more or less influence the sale of goods in one place or another. In determining the relative distribution possibilities of products which are common to the needs and desires of practically every one, it would be impractical to give attention to all those influences affecting the market as stated above. The two principal sales factors for this type of goods are purchasing units and income. A community with a reasonably dense population earning a fairly high income will be a good place to sell. While these two factors, viz., income and population, are fundamental they will not give an exact formula for predicting absolute results. So long as individuals are individuals, it will not be possible to derive a formula which can be applied universally even to a single line of merchandise.

A survey of the distribution of products would show wide variation as to the amounts consumed in different localities. Those products which are common to the needs and desires of practically everybody, such as coffee, sugar, salt, laundry soap, etc., already flow very evenly over the country. Population figures for this type of commodity should be a fair measure of the relative potential sales opportunities in each district. There are many other commodities which on account of being much desired by people generally would have a similar even flow in all sections of the country if the purchasing power of the people were evenly distributed.

It would, therefore, seem logical to assume that by properly weighting population and income, an index of the relative consuming power of communities could be obtained. In doing this, cognizance must, however, be taken of the fact as indicated above, that people and purchasing power are not evenly distributed. Some communities, though fairly densely populated, may on account of poor natural resources, lack of transportation, education, unfavorable climate, etc., have a low per capita income. Such localities may be average for the consumption of low-priced necessities, i.e., for commodities of general consumption, while for high-priced luxuries it may not rank very high.

WEIGHTING OF SALES FACTORS.—As has already been illustrated, when more than one factor is considered in determining the sales valuation of any particular territory, it is necessary to assign a definite weight to each factor. To illustrate, if population or customer units, past sales, and number of business enterprises are taken as factors for estimating the potential sales opportunity of a territory, the question of the **relative importance of each of these factors** arises. Should they be given equal weight, or should different values be assigned to each? The relative importance to be given to each is to a large extent a matter of judgment, since there is no method by which definite assignable values can be established. The fewer the factors to be considered, the less complex the problem of determining the relative weight of each will be.

In connection with the determination of territory valuation of those commodities for which there is a general market, i.e., those goods which are common to the needs or desires of virtually all human beings, a more complex problem arises. There are a few products in this category which already flow very evenly over the country. Illustrations are common articles of food such as salt, sugar, coffee, meats, etc. Many others could be mentioned which, though universally desired, are less widely consumed because of their relative costliness. In regard to marketing products included in the above class, there are a number of factors as previously stated, among which may be mentioned, education, transportation, and climate, all of which more or less influence the market for them. For practical purposes they may be regarded in the main as subsidiary. In the last analysis the basic factors are population and income.

WEIGHTING INCOME AND POPULATION.—The relative weight to be given to these two factors will depend upon the type of product with reference to the need it serves and its relative cost. For example, in the case of salt, a low-priced necessity which is used in every household, population preponderates. As we move away from this type of commodity, which is universally consumed, we find products which serve far more people less intensive wants and are less widely used because of their costliness. On the opposite end of the scale there is the high-priced automobile, a real luxury. Here income is the predominating factor. Hence as a **first step in weighting different factors** it is necessary to group commodities in some fashion according to their universality of consumption and selling price. In other words, establish a general classification of products ranging from those which are the least expensive and most generally used to those which are the most costly and which are bought and consumed by only a small percentage of the population. Such a classification can only be made arbitrarily, for there is no possible procedure for determining scientifically just how many divisions to make.

WEIGHTING OF INCOME AND POPULATION OR PURCHASING UNITS.—To illustrate this principle, assume that for practical purposes the various types of manufactured goods can be divided into nine different groups according to their universality of consumption. Merchandise in group one would include those commodities which are most widely used and which are generally considered as low-priced necessities, such as common table salt. Group two would embrace goods which are a little more expensive, and less widely used, and so on up to the ninth group in which would be found the highest-priced luxuries, such as high-priced automobiles, baby grand pianos, etc.

As a **first step,** before weighting these two factors for the purpose of determining the potential distribution possibilities of the products of any particular business, it is necessary to determine **what part of the population constitutes potential consumers.** As before stated the purchasing units will vary according to the commodity marketed. For some products the entire population may be weighted with the factor of income. In other instances consumption of the commodity may be limited to adults or women between certain ages, in which case only the percentage of the population constituting that number should be taken as purchasing units. Some personal consumption goods may be primarily bought by people engaged in certain occupations. In that case the number of people employed in those occupations constitute the purchasing units.

Having determined upon the purchasing units, the **next step** is to **weight against the income.** As, in group one, income is of less importance than purchasing, greater weight should be given to the latter factor. As we move away from group one towards group two the population further declines. Probably the proportion should be 9 to 1. In the final group the ratio of purchasing units and income may be reversed so as to stand 1 to 9. The weights to be given to each of the two factors, purchasing units and income, are only suggestive for the purpose of illustrating the principle of weighting. Each individual business has to determine the exact importance to be given to each factor. The theory underlying the principle is this: in the **low-priced commodities** population preponderates, while in the **more costly things** income is predominant, and for no type of goods can either factor be considered alone for estimating the potential sales opportunities.

Even in connection with the consumption of the cheapest articles consumed in the household a little more will be used per capita in the communities where

the income is greater because of the amount which might be wasted. Similarly, with regard to the high-priced commodities, population is a factor, for it is human nature to want to imitate, i.e., to desire to have the things which acquaintances or relatives possess. Some people will be found in every section of the country buying commodities whose cost is all out of proportion to their income, and there will be others who do not consume as much as they are potentially able to buy.

TYPE OF INCOME STATISTICS TO BE USED.—The results that can be obtained from the **population-income formula** will depend to a large extent upon the **reliability of the available income statistics.** Under the federal income tax law every person receiving a certain net or gross income is expected to make a tax return. If the returns were uniformly made by every individual receiving an income of $1,000 or more in each county of the several states, the **government returns** would be a fair index of the potential purchasing power in each sales district of an organization.

However, in a study of income by states made by the National Bureau of Economic Research, New York City, it was discovered that discrepancies existed in the number of personal returns made below $4,000. For some reason or another in some communities a greater percentage of tax returns are made in some states or parts of states than in others in which apparently the same economic resources prevail. In other words, people in certain states or parts of states seem to be more prompt and conscientious about making tax returns than in others. This applies to the lower income classes—those below $4,000. Above this amount the returns are probably uniformly made. A preliminary report, entitled "Statistics of Income," compiled by the Internal Revenue Department, gives a distribution of personal returns by income classes by counties for the calendar year of 1922 as follows: total number of returns; under $5,000; $5,000 to $10,000; $10,000 and over.

Obviously, the total number of tax returns, weighted with the population of each state and county, would not be entirely accurate for determining their relative distribution possibilities. However, while there is no constant ratio in each state between the number of returns ranging above $5,000 and those below, probably the results obtained by using only those returns of $5,000 and over would be sufficiently accurate for all practical purposes. When a more detailed classification of the income tax returns below $5,000 by counties is made available by the Internal Revenue Department so that all returns above, say, $4,000 are given, the income tax returns including all those of $4,000 and above, will probably be representative of each county, so as to make the income factor entirely dependable.

Reliable income statistics by states have been worked out by the National Bureau of Economic Research. This bureau contemplates carrying this work further and making a study of income by counties when sufficient funds become available to finance the project. When this is consummated, the problem of securing dependable income statistics both by counties and states will be solved.

PROCEDURE FOR DETERMINING RELATIVE DISTRIBUTIVE POSSIBILITIES.—Having outlined the principles underlying the determination of the relative sales opportunity for products having a general market, it is now possible to illustrate the procedure by means of a **concrete example.** In Fig. 4 is a chart of a hypothetical company which has its selling area divided into five large sales districts, each of which covers one or more states. The first column to the left gives the per cent of population each district has of the total population in the entire selling area, which may be a section of the country,

such as the New England States. Usually a concern of any considerable size sells in all the states. In this event the per cent of population in each district shows the ratio its population bears to the population of the whole country. The entire population of all the sales districts, whether they include part or all of the states, is represented by 100%. Similarly, in the last column is given the distribution of income by districts. District 1 has 25% of the total population and 15% of the total income. The 2d district has 10% of the population and 5% of the total income, and so on down through the list.

	Per Cent of Population	Group One	Group Two	Group Three	Group Four	Group Five	Group Six	Group Seven	Group Eight	Group Nine	Per Cent of Income
District 1.	25%	24%	23%	22%	21%	20%	19%	18%	17%	16%	15%
District 2.....	10	9.5	9	8.5	8	7.5	7	6.5	6	5.5	5
District 3.....	5	5	5	5	5	5	5	5	5	5	5
District 4.....	20	19.5	19	18.5	18	17.5	17	16.5	16	15.5	15
District 5.....	40	42	44	46	48	50	52	54	56	58	60
	100%	100%	100%	100%	100%	100%	100%	100%	100%	100%	100%

Computing weights of the above factors are as follows:

Group One	9	Income	1
" Two	8	"	2
" Three	7	"	3
" Four	6	"	4
" Five	5	"	5
" Six	4	"	6
" Seven	3	"	7
" Eight	2	"	8
" Nine	1	"	9

FIG. 4. Chart Indicating Method of Determining Relative Sales Opportunity, according to Population and Income, for Products with Varying Markets

	Potential Distribution (1)	Actual Distribution (2)	Actual Sales (3)	Potential Sales (4)	(5)	Distribution of Sales by Districts After Estimated Increase is Added (6)
District 1	24.0%	22%	$ 2,200,000	$ 2,400,000 × 1.057692	=	$ 2,538,461
District 2.....	9.5%	10%	1,000,000	1,000,000 × 1.057692	=	1,057,692
District 3	5.0%	8%	800,000	800,000 × 1.057692	=	846,154
District 4.....	19.5%	20%	2,000,000	2,000,000 × 1.057692	=	2,115,385
District 5.....	42.0%	40%	4,000,000	4,200,000 × 1.057692	=	4,442,308
	100 %	100%	$10,000,000	$10,400,000		$11,000,000

FIG. 5. Chart indicating Potential Sales Opportunity, According to Population and Income, for a Particular Concern

By weighting these two factors, viz., population and income as indicated in Fig. 4, we get a fair measure of the relative possibilities for each district. This measure can be used as the basis for apportioning the company quota among the sales districts and sales branches. In Fig. 5 is an illustration of how the

quota of a hypothetical concern may be distributed on the basis of potential sales opportunity. In this illustration it is assumed that the products fall in group 1. Column 1 gives the per cent of potential distribution according to population and income. Column 2 gives the actual distribution of sales for each district. The 3d column gives the actual sales in dollars, while in the 4th is indicated what the volume of sales should have been had each district been developed in proportion to its sales opportunity. A comparison of the potential with the actual distribution as given in columns 1 and 2 indicates that the sales development in some districts is greater than in others, a condition which no doubt is typical with every concern selling in a national market.

The sales in district 1 are below the potential buying power by 2%; district 2 is ½ of 1% above; the 3d district is 3% above, while the 4th district is ½ of 1% above. However, the 5th district is 2% below. The potential sales volume in dollars should as indicated in column 4 be adjusted to sales opportunity.

Now suppose the increase in sales of this particular concern for the following year is to be 10% of $10,000,000, as given in column 3. What proportion, theoretically, should go to each district? Column 4 gives the volume of business that should have been done had the districts been developed according to their sales opportunity. Since an increase of $400,000 or 4% of additional sales over the preceding year has already been distributed, only $600,000 more needs to be apportioned to bring the total up to $11,000,000. By dividing $600,000 by $10,400,000 we get the per cent to be added to each district to absorb the estimated increase. Column 6 gives the respective amount of sales for each district after the 10% increase for the year has been added.

ADJUSTMENT OF SALES QUOTA TO POTENTIAL POSSIBILITIES.—Whether or not the actual sales quota should be adjusted to the potential distribution possibilities in the several districts of any particular concern as indicated by the weighting of population and income and the period in which the adjustment should be made, is a matter for the executives to determine. The formula indicates the sales opportunity, and this gives the management a **basis for formulating sales policies.** For various reasons, such as high freight charges, intensive competition, lack of capital, etc., some districts may not be as far developed as others, because the management may have deemed it more profitable to concentrate sales efforts in those territories which show greater immediate results. Therefore, even if the facts about the relative sales possibilities as indicated in Fig. 5 are known, those districts which have produced more than their proportion would be assigned a certain percentage of increase over the previous year's sales. Because of the goodwill established it would be no doubt economical to increase the sales in these districts to some extent.

In those districts where it is desirable **to balance sales volume with sales opportunity,** the adjustment should be made over a period of several years; for it would ordinarily be very difficult, particularly in normal times, to stimulate the sales of any individual business in one year's time, so as to exceed the previous year's record, without incurring a very heavy sales expense. Local conditions in each district should also be considered. A goal might, however, be set up with the view of making the adjustment over a period of years, adding on a certain percentage of increase each year. Simultaneously with the increase in volume, the selling expense for sales effort should also be increased.

In order to secure **practical operation of the formula** so as to serve as a basis for indicating potential distribution possibilities, **adjustments** will have to be made in some communities. Like every principle and procedure, it must be applied with common sense. On account of the climatic conditions in the extreme northern and southern states, consumption for certain types of com-

modities may be greater or less per capita than in the eastern and central portions of the United States. When this is found to be an important factor, a standard may be set up for the purchasing units in the central and eastern parts of the country, and those in the abnormal regions may be adjusted accordingly. A thousand people in the South may be equal to six hundred in the central part of the United States; or for some types of goods the ratio might be reversed. The proper ratios can be determined from past sales records and sales research.

In conclusion it should be noted that it is distribution that is being predicted in setting quotas as here described, and not the gross amount of business to be sold during any particular period. This procedure should serve as a basis for distributing or apportioning the company quota as previously explained above. This procedure is particularly applicable to those products which are generally distributed. The estimate of the company quota is based on other considerations, as has been previously explained. But given a specific amount of new business that a company desires to set up for its goal, the problem in quota-setting is to get the most equitable distribution of this amount among the several districts, branches, and salesmen's territories. Under the plan as outlined above it is possible to give each selling unit a goal that is equally difficult to attain. The quotas under this arrangement may be increased or decreased by a definite percentage and thus make the task for all selling units more or less difficult. But each unit is given an approximately equal load to carry. It is thus possible to make a direct comparison among the selling units as to the per cent of quota each attains.

Sales Cost Finding

In the early part of this section it was shown that volume of sales is an important factor from the standpoint of producing profit on the investment. The profitableness of a company depends, on the one hand, on the gross revenue it receives, i.e., on the receipts from sales, and on the other hand, on the amount of expense involved in securing them. What every aggressive manufacturer and distributor desires to do is to increase his sales so that the full plant capacity will be utilized. The operation of such a sales program not only involves a great deal of expenditure for soliciting business, advertising, etc., but also for taking care of the **overhead incurred in physical distribution.**

As a result of the great development of the production facilities within the last 25 years, together with the conditions growing out of the World War, there has been developed a tremendous capacity for manufacturing goods of all kinds, and coincident thereto a keen competition for markets. Expenditures for sales efforts have been increased to such an extent that in many lines it costs more to sell than to produce. The great problem confronting practically every sales manager today is to sell at a profit. There are few concerns which could not increase their sales by increasing their sales expense. But sales are desired only when profits will result. As pointed out before, in order to produce and sell most effectively there must be a **close co-ordination of sales and production.** There is a point beyond which it will not pay to extend the business, because the additional revenue from sales is more than absorbed by the increase in cost. Effective sales administration rests on a **proper analysis of sales costs and reports.**

SALES VERSUS PRODUCTION ACTIVITIES.—Because of the peculiar character of sales expenses and the circumstances under which they are incurred,

it is very important that they be closely considered and carefully analyzed in order to realize maximum returns from the sales operations. When control is not properly established, this class of expenditures in particular has a **tendency to increase unduly.** As compared with production, sales activities are largely of an intangible character. In the production end of the business we have physical processes which are repetitive and which are carried on within a limited area of operation. There is only one human factor, the operators of the machines. In selling there are two human factors to deal with, viz., the salesman and the prospective purchasers.

Sales methods are **only partially subject to standardization,** as they are varied necessarily by conditions of trade and competition. On account of the nature of the work the field sales organization is scattered and is only periodically under the direct supervision and personal touch of the executive. In general, the services received for the expense incurred by the sales department are of an intangible sort and difficult to appraise. Advertising, for example, is one of those items the direct benefit of which is very difficult to determine. The same is true of expenditures for salesmen's services in sales territories which are in the developmental stage. Similarly, the promotional activities of every sales organization are always more or less of a speculative type.

In the case of a purchase of physical materials to be used in manufacturing it is possible to correlate directly the merchandise obtained with the value of the finished product made from the materials. On the other hand, it is not possible to predict very accurately the number of sales that may be forthcoming as a result of certain expenditures for advertising space. Sales may be secured as a result of advertising and salesmen's efforts some time after expenditures for these items have been incurred. On account of this difficulty in appraising the results of sales expenditures, executives are likely to think that a certain amount of selling expense is necessary and should be incurred irrespective of the fact that direct results cannot be determined. There is a tendency not to examine critically enough the amount and nature of these expenditures.

Because of the **intangible character of sales activities** standards are more difficult to determine than in the plant operations. For example, it is possible to determine the amount of material and labor necessary to produce a certain article and then use this as a standard for estimating the quantity of materials necessary in producing that article. On account of various economic factors there is, however, no exact procedure for determining the amount of selling expense necessary to secure a dollar's worth of expense.

COMMON SALES COST PRACTICE.—Up to the last decade very little attention has been given to sales costs. Consequently we have no sales-cost accounting which in any way parallels the precision of unit-cost analysis as found in the production departments of some manufacturing concerns. Cost accounting treatises have been entirely devoted to the discussion of principles pertaining to production costs. In this field, methods pertaining to cost control have not been developed. The discussions on sales-cost technique are, indeed, fragmentary and have not yet found their way into treatises on cost accounting.

Instead of analyzing and allocating sales costs most concerns lump all their selling costs and consider them as a flat percentage upon the selling price. For example, the cost of advertising, salesmen's salaries, traveling expenses, and the so-called overhead items, are given lump-sum consideration, i.e., each of these items is expressed as a ratio of the sales price. Such figures are of little value, since the actual profit or loss by territory, by salesman, and by customers is not shown. In so far as possible a profit should be made on every one of these factors. It may never be possible to reach that goal, but proper analysis of

costs will at least indicate which of the above units are profitable and why. Not only that, it will show which are unprofitable and why, and thus will point the way to make each stand on its own feet.

If the entire output, for example, is sold to a few large distributors or consumers, the manufacturer's **problem of allocating sales costs** is not difficult, for then the real burden of sales-cost control falls on the distributors who sell to the retailers or consumers. When such a selling policy is followed it is quite proper to allocate the sales cost as a percentage of the selling price, for it is customary to bill jobbers at the list price less the jobbers' discount. The discount to the manufacturer is a selling expense allowed to the distributor for performing a selling function. Obviously, when such a method of marketing is followed, the manufacturer needs no elaborate cost system as a basis for effective sales administration. A great majority of the manufacturers do not limit their policy of selling to large purchasers and jobbers, but sell direct to retailers and consumers, and consequently need a more effective accounting system for the control of sales operations.

FLAT PERCENTAGE INADEQUATE AS A MEASURE OF SALES EFFICIENCY.—For several reasons a general ratio of selling costs to sales is inadequate as a measure for the effective control of sales costs. In the first place, it fails to indicate the efficiency or profitableness of the salesman or the territory. When costs are not allocated to territories, salesmen taken as a group may be profitable, but at the same time among them some may be consistent losers. The writer saw an analysis of sales costs made by a profitable concern in which one salesman whose sales were around $7,500 per month made a profit of only $100 for the company.

In the second place, it has a tendency to **emphasize volume of business at the expense of profits.** In other words, it has a tendency to measure sales success by the amount of goods sold rather than on the amount of profit produced. Volume of sales can neither be taken as an absolute measure of successful sales effort nor as a measure of profitableness. For example, customers are not all equally difficult to sell to; an order obtained for $500 does not necessarily involve a sales cost of $50 in case the ratio of the salesman's operating costs to sales happens to be 10% of his sales. A manufacturer selling his products to a national market in competition with other goods will for various reasons find it more difficult to sell in some territories than in others. A salesman may take considerable time to work up a small order which may not be repeated while a large order may be obtained through the mail at the cost of a postage stamp. Then, too, not all lines carry the same margin of profit. The salesman selling $10,000 of merchandise may be more profitable than his competitor whose sales are twice as great.

In the third place, the per cent of cost to sales leaves the sales manager without adequate statistics for **appraising the salesman's work in a particular territory.** When products of continuous consumption, such as food, clothing, stationery, supplies, etc., are sold direct to dealers or large consumers, data pertaining to the profitableness of individual accounts is very helpful in establishing correct sales policies. It is not only important to know to what extent a sales territory is profitable or unprofitable, but in the latter case there should also be evidences pointing out the cause of its barrenness.

Where manufacturers sell to jobbers, as many do, the problem of costing accounts is far less complicated. Unit sales are relatively large and frequent solicitation is not essential. Under this method of distribution the manufacturer usually employs two types of salesmen, the one calling on jobbers in their respective territories, and the other type being those, known as "missionary"

salesmen, who solicit orders for the jobbers among dealers. When this method of selling is followed, it is impossible to determine the cost of selling dealers, because the manufacturer does not carry their accounts on his books and has no knowledge of their volume of purchases. It is assumed that the volume of business secured from wide distribution is sufficient to offset the high cost of selling the small accounts in any community.

NEED FOR SALES-COST ANALYSIS AND REPORTS.—The progressive manufacturer understands the necessity of determining accurately the cost of manufacturing the various articles that make up his line. Of no less importance to him is the cost of marketing his products, not merely taking the field as a whole but in detail—which salesmen, branches and agencies are making money for him and which are not.

While it is true that the results of expenditures for advertising and sales promotion cannot be definitely determined, a careful study of these items in relation to the sales program will have the tendency to keep sales costs at a much lower figure and at the same time produce results equally as satisfactory. Reports on sales cost are essential in selecting the right method of selling. On the basis of reports on the salesmen's operating cost, the sales manager will be able to determine (1) whether the salesmen's territories are properly laid out for economical operation, (2) whether they are producing profits in accordance with their possibilities, (3) whether the salesmen are efficient. When sales branches are operated, there should be reports giving similar facts not only with reference to each branch as a whole but also to the territories comprising each branch. Such information is indispensable to sales management as competing firms are very active in making inroads in each other's business. Redistricting of territories and changes in the method of distribution need, therefore, be made from time to time. To direct salesmen most effectively it is necessary to have accurate knowledge of sales cost in every territory.

THE APPROACH TO THE ANALYSIS OF SALES COSTS.—Because of the different conditions under which concerns operate and the various types of products manufactured, it is impossible to give a single method which would apply equally well to all business. The discussion which follows will be confined to illustrating principles of allocating selling expenses for the purpose of **determining some unit cost** or measure which can be used as a standard for judging the operating efficiency of the salesmen, and the variation of cost from month to month. The first question to be decided is what unit of cost is to be determined. Is it desirable to get the selling cost and profit by lines of products, by salesmen, or sales territories, or some other unit?

COST OF SELLING BY LINES.—In manufacturing activities it is customary to determine the cost of each item so as to develop a manufacturing profit and loss by lines. This procedure cannot be applied very well to selling for several reasons. Except in an unusually simple business it would be exceedingly difficult to get an accurate measure of the sales effort required to sell each item of an entire line. This would be comparatively simple if the sales force were made up of specialists, each of whom confined his efforts to but one item of product. In practice the salesman sells the entire line; his selling effort to a large extent is measured by the number of calls and sales that he makes and the amount of net profit resulting therefrom. It is not likely that his expense or calls would be reduced if he carried one or two less. W. R. Basset, President of Miller, Franklin & Basset Co., says:

"It is more important to make sure that the selling price and the cost of every item carried by the salesmen are such as to make the item salable and

to leave a satisfactory manufacturing profit. We can quickly tell that item D, say, does not sell in a given territory as well as the other items. This will lead to an investigation which may show that the price is not right, that the buying habits of the territory preclude the sale of item D, that we are not covering that territory adequately with advertising, or simply that the salesman is not enthusiastic over the item. If the last, it may pay to offer an incentive to the salesman to push that item, or perhaps to fire him, if that cure be indicated. Whatever the reason, our reports have indicated the condition and our investigation has shown the cause. If it appears that item D is entirely unsalable there, and if the necessary sales expense cannot be borne by the remaining lines and leave a profit, we may decide to withdraw from that territory entirely."

The determination of selling cost by items is not so important as it might seem at first thought, for in selling it is essential to consider the purchaser's needs and desires. In certain industries it is necessary to furnish the dealers with a complete line even though some items in the line are not profitable. Then, too, the manufacturer with specialized equipment, whose output is limited to certain lines of products, must determine where he can sell at the lowest possible cost what his factory is best equipped to produce. In order to do this, he should so co-ordinate the sales and production program that the highest aggregate net profit will result. Some of the lines may just be burden carriers, i.e., they may be sold at a price which will probably just pay for the cost of material and overhead. Under such conditions nothing would be gained by dropping these lines so long as they do not produce a "dead" loss to the business.

The profit on the ordinary articles of commerce is essentially an **average attained on the unit sale to the customer.** Certain costs must then be averaged. While there are a few cases where the **cost per item** may be desired, in most instances the selling cost develops into a relation to the dollar of sales, i.e., the number of cents it takes to make a dollar sale, expressed in per cent. In those organizations where the advertising activities are general, it is impossible to allocate it to the salesmen's territory or customer's accounts except on an extremely arbitrary basis. Under such conditions the first two headings are sufficient. The problem of determining the profitableness of salesmen and territories is simply a matter of **allocating direct and indirect expenses.** The direct expenses can very readily be assigned to each salesman. The indirect expenses must be distributed on some basis. Various methods of apportioning the selling overhead will now be discussed.

CLASSIFICATION OF SELLING EXPENSE.—The determination of the profitableness of salesmen's territories and customer's accounts on a reasonably accurate basis contemplates a careful classification of the expenses incurred in each salesman's territory. The number and nature of the expense items will depend upon the type of business, i.e., the products it sells, and its policy of sales administration. Ordinarily we can consider the items under three general headings as follows:

1. Salesmen's Direct Expense.—This includes salesmen's salaries, commissions, traveling expense, supplies, etc.

2. Management or General Selling and Office Expenses.—The items included under this heading in the home office type of sales organization, where all salesmen travel from the home office under a sales manager, are: salaries and expenses of the sales manager, his assistant, stenographers, and other office force employees engaged in gathering and maintaining sales data,

records; also postage, depreciation on office equipment, telephone, and telegraph, etc.

When the **sales organization is decentralized** and district branch offices are operated, there is in addition to the cost of maintaining the home office the expense of maintaining the **local sales offices.** The expense items vary with the functions performed by the branches. The main items included in this heading in a sales branch are manager's salary, rent of office, salary of clerks, postage, stationery and supplies, telegraph and telephone charges, depreciation of office, delivery equipment, etc.

3. Special Advertising.—This includes expenditures for special advertising in the sales territories in newspapers, moving picture houses, local newspaper allowances to customers, advertising material, cuts, etc., distributed to dealers or agents.

PROFITABLENESS OF SALESMEN OR TERRITORIES, AND CUSTOMERS.—From the preceding discussion it would seem that the important thing to know is the **profitableness of salesmen and customers** rather than the cost of selling by lines. This conclusion is confirmed in the quotation given below from a sales manager of a national sales organization which has made a study of distribution.

"If we know that we are making some profit on the business we do with each customer, and that the amount of net profit we derive from each customer is satisfactory, we would not need to worry a great deal, even though it could be shown that we are losing money on some of the material we sell them or on some of the small orders they give us." (O. D. Street, General Sales Manager, Western Electric Co.)

Whether or not costing of customers is important depends on the method of selling and the type of commodity sold. The manufacturer who sells his goods to jobbers and operates a sales force of "missionary" salesmen who call on dealers to stimulate the demand for his goods, would not attempt to determine the cost of each retail distributor, as the company carries or has only a record of the jobbers' accounts. It is the jobber who carries the retail accounts under such a system of selling. Neither is the costing of accounts of those concerns selling one-time specialties, such as bonds, vacuum cleaners, office appliances, insurance, etc., important. Such concerns are, nevertheless, vitally interested in the productiveness of sales by territories.

PROFIT AND LOSS BY SALESMEN AND TERRITORIES.—The steps involved in determining the profit and loss by territories may be summarized as follows:

1. Credit the territory or salesman with the gross amount of selling profit his sales produced during a given period.
2. From the gross selling profit deduct the salesman's direct expense.
3. Deduct "special advertising" expense if advertising of this type has been done.
4. Deduct a pro-rata amount of "management or selling overhead."

The salesman's direct expense, salary, commissions, traveling expense, bonus, etc., can be directly allocated to the salesman or the territory in which he operates. The difficult problem arises in connection with the equitable **distribution of the selling overhead,** that is, the sales office expense. These items cannot be charged directly to the territories but must be allocated on some basis. It is highly important that this overhead be apportioned on a

fairly accurate basis in order to show the true performance of salesmen and territories.

Three methods of apportioning the overhead will be explained. They are:

1. On the basis of sales.
2. Equally among the sales territories or salesmen.
3. On the basis of a predetermined sales quota.

SALES VOLUME AS BASIS OF APPORTIONING OVERHEAD.—As the distribution of manufacturing costs on the basis of direct labor usually leads to incorrect results so the apportioning of selling expense on the basis of sales volume gives **results equally unsatisfactory.** When selling overhead is apportioned on the basis of sales, total sales for the territory of the branch is taken as the basis, and the percentage of overhead assigned to each salesman is the percentage of his sales to total sales, irrespective of the sales quota. For example, if a branch has ten salesmen and its sales amount to $100,000 for a given period, and salesman Smith sells $40,000, he would be charged with 40% of the total general overhead, even though his quota for the period was only 20% of the total sales. The more a salesman sells, the greater will be the amount of overhead with which he will be charged.

SELLING OVERHEAD DISTRIBUTED EQUALLY AMONG SALESMEN.—On the theory that each salesman requires ordinarily about the same amount of supervision and benefits about the same from the efforts of the management, it is argued by some that overhead might for practical purposes be apportioned equally among the salesmen. If, for example, the overhead amounts to $1,000 for a given month or period, and there are ten traveling salesmen, $100 would be charged against each salesman or territory as the proper share of overhead.

The chief argument in favor of this method is that it is easy to administer. In some businesses it will probably give results sufficiently accurate for practical purposes. In case of certain new territories which require an undue amount of the sales manager's time, it might be advisable for the manager to keep tab on the amount of time spent in supervising each territory. This can be done by having him make an informal note of the time consumed in directing the activities of each territory.

ADVANTAGES AND DISADVANTAGES OF THE SALES AND SALESMAN PRO-RATA METHODS.—As is obvious from the discussion of this and the first method mentioned of apportioning overhead the chief advantages lie in their **simplicity of application.** The practice of taking sales as a basis for determining expense ratios is very popular among accountants and sales executives. It is easy to understand and no predetermined amounts of expenses are required. Both methods are applied at the close of the cost period, when the actual sales and expenses have been incurred. The clerical labor necessary to make the computations is small. In certain types of sales organizations, when salesmen are all practically equal in efficiency (a condition which seldom if ever exists), these methods may give fairly accurate results.

The **principal objection** to these methods is that in most cases they fail to reveal the actual status of a territory or salesman with regard to profit or loss. Take the first method which provides for the apportioning of overhead on the basis of sales. It is illogical, for if a salesman sells twice his quota, there is no justification for charging him with twice its pro-rata of overhead. The cost of overhead does not increase in proportion to sales, particularly after the quota has been attained. The distribution of overhead as a percentage of sales, futhermore, does not locate the real source or extent of territorial profit and loss. The territory which is really unprofitable is the one which fails to reach

the point necessary to its proper share of the selling overhead. If the overhead in such a territory is apportioned on the basis of sales made therein, the amount it should be charged with is decreased and the lack of its profitableness is obscured. In effect, this method has the tendency to overstate the profit or loss of a poor territory and to understate the profit of a good territory which shows a rapid increase in sales.

As an illustration, suppose that of two territories which are valued approximately equally as to sales possibilities, one produces twice as much sales volume as the other. If the first is charged with twice as much of the overhead the true performance of the two salesmen will be incorrectly stated. Obviously, according to this procedure, if one of the units sold nothing at all during the period, it would be charged with no overhead.

This can be illustrated by taking a simple example of a company operating in several states with a sales organization of the home office type in which the salesmen are under the direct supervision of the sales manager and travel away from the city where the factory is located. Each salesman has a separate territory which may be a state, several counties, or a portion of a large city. Assume that there are ten salesmen in the organization and they sell during a given month $60,000 of goods, incurring a selling cost of $6,000. Dividing the selling expenses by the sales shows a sales cost of 10%, i.e., the average cost of selling a dollar's worth of goods in each territory is 10% on the sales price.

Suppose the gross selling profit was $20,000. After deducting $6,000, the amount incurred in selling, a net selling profit of $14,000 is left, and an average net profit on the sales in each territory of 23 1/3%.

Now assume that of the $6,000 selling cost $5,000 was paid for salesmen's commissions and traveling expense, and $1,000 constituted selling overhead. How much of the overhead should be borne by each salesman if the sales of each were as follows:

Total Sales	1	2	3	4	5	6	7	8	9	10
$60,000	$4,000	$3,500	$5,000	$4,500	$7,000	$7,500	$8,000	$6,500	$8,000	$6,000

By distributing the overhead of $1,000 on the basis of sales, i.e., the ratio each salesman's sales bears to the total amount $60,000, the following amounts result:

Total Amt.	1	2	3	4	5	6	7	8	9	10
$1,000	$66.67	$58.33	$83.33	$116.67	$75.00	$125.00	$133.34	$108.33	$133.33	$100.00

This procedure, though easy to administer, is not a true measure of the relative profitableness of the salesmen. So far as the salesmen are concerned it leaves much to be desired. For example, if the salesmen are paid a bonus on the net selling profit of their territory, in addition to their commission and salary (not an uncommon arrangement in actual practice), this procedure would have a tendency to penalize the good salesmen and to favor the poorer ones. For example, suppose territories of salesmen No. 1 and 7 were both approximately equal as to sales possibilities. Looking at the sales figures, however, we find that No. 7 sold twice as much as No. 1. By distributing overhead on the basis of sales as indicated above, the net operating profit of territory No. 7 is understated while that of No. 1 is overstated. Under this procedure no charge would be made for overhead to a territory in the event that no sales were made during a given period. In case these territories are sales agencies or branches and general sales overhead is apportioned as above, equally incorrect conclusions as to the profitableness of each will follow.

APPORTIONING SELLING OVERHEAD ON THE BASIS OF PREDETERMINED SALES QUOTAS.—This method is similar to the one discussed in the foregoing except that the overhead is apportioned on the basis of predetermined sales quotas. Each territory is charged with overhead in the ratio that its quota bears to the total sales quota of the branch, or the entire sales organization if the salesmen operate from the home office. For the purpose of control this **method is superior** to the method outlined above. In the first place, it presupposes a carefully computed sales quota for each territory. The sales quota then becomes the basis on which the estimated overhead is to be apportioned to each territory. Obviously, allocation on a basis of sales cannot be made until the end of a period and consequently it does not provide figures which are available sufficiently early for the most effective control. As indicated above, under this plan the branch sales quota is taken as the basis and the proportion of that quota assigned to each salesman establishes the proportion of overhead that is to be borne by him.

Sales quotas, as has been explained, have a definite relation to the amount of expense to be incurred during a particular period. They indicate the amount of sales that should be reached to make the respective territories fully profitable. When careful records of sales costs are kept, the results under this method can be made available much earlier than under the other two methods, since the sales quotas are known before the sales are made. Accordingly, this method **provides check-ups** from which the sales or branch manager can formulate plans to bolster up those territories and salesmen who are not making their quotas and consequently contributing less than their proper share of profit to the concern.

In organizations where fairly scientific sales quotas can be determined this method is probably more equitable than either of the other two outlined in the preceding pages. While no method can be devised which can be said to be absolutely accurate, the distribution of selling overhead on the basis of sales opportunity is theoretically sound, as the territory should be the basis for proper sales costing. As already noted, the distribution of overhead on the basis of the sales quota contemplates fairly accurate territory valuation. This is very important, as little can be done to allocate selling expense on a fairly accurate basis unless there is a reasonably definite estimate of the amount of business a territory should produce. Not infrequently "star salesmen" when shifted to another district prove to be complete failures.

COSTING CUSTOMERS' ACCOUNTS.—The foregoing analysis of selling costs makes it possible to get the unit cost of selling individual accounts. The **selling expense by accounts** can be resolved into three elements as follows:

1. Salesman's cost, which includes the salesman's direct expense and a portion of the management expense.
2. The cost for special advertising.
3. The cost of clerical and warehousing services.

The extent to which it is desirable to give the above costs on accounts in detail depends upon the conditions of the individual business. Most companies probably would not find it practical to attempt to allocate expense to customers' accounts. The **salesman's cost per call** in many businesses would seem desirable. Besides serving as a measure for establishing the profitableness of an account, it may also be used as a unit of selling expense which can be compared with a normal or standard. This affords a splendid check on the salesman's activity. For example, a normal expense per call for each territory can be developed as a **standard cost.** This standard can then be compared with actual performance

from month to month. When significant variations occur, proper explanations should be made of the cause. In case the actual cost is higher than the standard, one of two things is evident—either the salesman is making fewer calls, or else he is spending more than normally.

The selling cost per call can be determined by dividing the salesman's cost for a month by the number of calls he made during that period. By adding to this the direct cost of advertising and the cost for "clerical and warehousing service," the **total cost of handling accounts** is obtained.

The standard cost per call in most sales offices or districts will not necessarily be uniform or nearly so. The method of traveling, whether by train or automobile, the size of the towns and cities, and the distances between them, all directly modify the number of calls a salesman can make. Accordingly, there is a variation in the traveling expense in practically each territory.

FIDUCIARY RELATIONS

DEFINITIONS.—The English word "fiduciary" is derived from the Latin *fiducia*, faith. It is defined in our dictionaries as "a person who holds a thing in trust," and **attorneys, guardians and trustees** are cited as examples of fiduciary relationship. There are many situations arising in everyday life in which a fiduciary becomes a useful or even a necessary instrument for the effective transaction of business. The Anglo-Saxon words **trust** and **trustee** are practically synonymous in meaning with fiduciary and are more commonly used.

A fiduciary relationship or trust may be either **express or implied;** that is, it may be expressly created by a will or a deed, or it may arise from an equitable consideration of the acts or situation of the parties.

The following are some of the **usual forms of fiduciary relationships:**

Executor of the will of a deceased person.
Administrator of the estate of a deceased person.
Trustee under the will of a deceased person.
Trustee under an agreement or deed of trust.
Guardian of the property of a minor.
Guardian or committee of the property of an incompetent person.
Trustee under a corporate mortgage.
Transfer agent, registrar or fiscal agent for corporations.
Depositary under voting trust agreements.
Escrow agent.
Receiver of the property of an insolvent or liquidating corporation.

Estates

DUTIES OF AN EXECUTOR AND OF AN ADMINISTRATOR.—The duties of an executor and of an administrator are essentially the same. The executor or administrator is said to be the **personal representative** of the decedent, all of whose personal estate vests in him. All of his **duties** are comprehended under three headings: (1) collection and liquidation of assets; (2) payment of debts, administration expenses, taxes and legacies; (3) distribution of the residue of the estate to the persons entitled to receive it. The only difference between the two functions is that an executor is governed by the terms of a will, which may give legacies to persons or institutions entirely outside of the family of the testator, as a person who makes a will is called; while an administrator is governed by the **law of intestate succession.** A person who dies without leaving a will is said to be **intestate** and his property is distributable among his heirs and next of kin in proportions fixed by law, which differ somewhat in different states. In case the executor named in a will dies or for any other reason fails to complete the settlement of an estate, some

other person must be appointed to finish his work. This person is called an **administrator c. t. a.** (*cum testamentum annexo*) or **administrator with the will annexed,** and he is guided by the terms of the will, just as if he had been named therein as executor.

There is still a third kind of administrator—a **temporary administrator.** This is an officer appointed by the court to take temporary charge of the estate of a deceased person when an executor or a permanent administrator can not legally qualify to act without undue delay, such as might occur in case of the contested probate of a will, or the absence from the jurisdiction of parties whose consent to the probate is necessary, when such delay would work injury to the estate. The authority of a temporary administrator is limited to the preservation of the assets of the estate. He cannot dispose of them or pay any bills, except under the direction of the court by which he was appointed. Sometimes the person named as executor in a will is appointed temporary administrator pending his qualification as executor.

QUALIFICATION OF EXECUTOR OR ADMINISTRATOR.—While the authority of the executor is derived from the will and that of the administrator from the intestacy law, neither officer can take possession of or deal with the estate of his decedent until he has been authorized to do so by a **court having probate jurisdiction.** In some states this is called a **"probate court,"** in others a **"surrogate's court."** Sometimes another court is charged with this responsibility. The will, if there is one, **must be filed and proved** in accordance with the law of the state of which the testator died a resident. The surrogate or other proper public official then issues to the executor a certificate of the fact that the will has been admitted to probate and that the executor has duly qualified. This certificate is called **"letters testamentary,"** and is a testimony to all the world of the executor's authority.

In case the decedent left no will, this fact must be proved in accordance with the law and practice of the jurisdiction, and the court will then issue **"letters of administration"** to some person who will undertake the settlement of the estate. The law differs somewhat in different states, but the general practice is to grant letters to the nearest relative, who is capable and willing to act, in a certain order of preference. A husband would be entitled to administer upon his wife's estate, a wife upon her husband's, the eldest son upon the estate of his father or mother, etc. In case any of the relatives entitled to preference are not capable or desirous of acting, the next in order of preference would be appointed. If there is no relative who can or will act, a creditor may be appointed as administrator, or the **public administrator** will be called upon to take charge of the estate.

The law usually requires that an executor or administrator shall **furnish bond** for the faithful performance of his duties. The amount of the bond is determined by the amount of the estate. Formerly individuals became surety for the executor or administrator, but now the practice of securing bonds from surety companies has become almost universal. A testator may provide in his will that his executor shall not be required to give any bond, though the surrogate may nevertheless require one if the law so provides. An administrator is always obliged to give a bond.

An executor or administrator **may resign** with the consent of the court, and may be **removed by the court** for improper management of the estate. If he resigns or is removed or dies his successor is appointed by the court.

REMUNERATION OF EXECUTOR OR ADMINISTRATOR.—The executor or administrator is compensated by **fees or commissions,** which are fixed by

law. These differ in different states. They usually are **fixed upon the amount of the estate** and sometimes take into consideration the character of the estate and the nature of the duties devolving on the executor. For example, in the **State of New York** a fixed commission is allowed at the following rates:

5% on the first	$ 2,000
2½% on the next	20,000
1½% on the next	28,000
2% on all over	50,000

In the **State of New Jersey,** the rates are as follows:

"Not exceeding

7% on the first	$ 1,000
4% on the next	4,000
3% on the next	5,000
2% on all over	10,000

"The commissions of executors, administrators and trustees in any estate where the receipts exceed the sum of fifty thousand dollars, shall be determined by the orphan's court on the final settlement of their accounts according to the actual services rendered, not exceeding five per centum on all sums which come into their hands."

It will be seen that in the first case, the executor is not entitled to receive more than a certain sum no matter what the work and responsibility involved in the settlement of the estate, while in the latter case the court has authority to allow compensation for unusual services up to a fixed maximum amount.

HANDLING OF PERSONAL AND REAL PROPERTY.—When an executor or administrator has qualified and received his certificate of authority from the court, his first duty is to **take possession of the personal property** of the decedent and arrange for its safekeeping. He should have **an inventory and appraisal** made by competent appraisers, and **record all his transactions** in proper books of account. Bank accounts of the decedent should be transferred to a new account in the name of the estate, and securities and jewelry should be put in a safe deposit vault in the name of the estate. Particular care must be taken not to mingle the money or valuables of the estate with the personal moneys and effects of the executor or administrator, who will be held strictly accountable for them. All **perishable assets**, and all **stocks and bonds,** except such as are specifically bequeathed, should be converted into cash without delay. Otherwise in case of loss incurred by holding them, the executor or administrator will be held personally liable.

Real property does not pass to an executor unless the will gives him authority over it, but vests in the **devisee** under a will or the **heirs-at-law** of the decedent if there is no will. There may be circumstances, however, in which an executor or administrator would be required to see to the preservation or insurance of real estate until the devisee or heir shall be advised of his inheritance and have an opportunity to take possession of it.

PAYMENT OF DEBTS.—After the personal property has been taken over and inventoried, the next duty of the executor or administrator is to ascertain and pay the debts of the decedent. Out of the first funds which come into his hands, he pays the **funeral expenses,** which are preferred claims. The law usually provides for **notice to creditors** by advertising for a period of say 6 months, the advertisement calling on all persons having claims against the decedent to present them to the executor or administrator at his place o

business before a certain date. Unless the executor or administrator has personal knowledge of the correctness of claims presented, he should require proof of their justice by the affidavit of the claimant. Upon the expiration of this period of advertising, or of such other time as the law may prescribe if no notice to creditors has been published, the debts should be paid. In case the estate is not sufficient to pay all of the debts in full, they must be paid pro rata after provision has been made for the payment of the expenses of administration.

PAYMENT OF LEGACIES.—After provision has been made for the administration expenses and the debts, legacies must be paid. The period allowed for the ascertainment of debts is usually one year, or if a creditors' notice has been advertised, six months. Legacies cannot safely be paid before the expiration of this period, but sometimes an executor can be reasonably sure that the personal estate is ample to pay all of the expenses and debts and is willing to pay a legacy wholly or in part at an earlier date and to personally assume whatever risk there may be in so doing. In case a legacy is paid before the date when it becomes due, it should be **discounted at the legal rate of interest,** because the **residuary legatee** is entitled to the interest earned by the whole estate during the period fixed by law for the ascertainment of debts. The same principle applies in case an administrator shall make a **partial distribution of the estate** of persons entitled to share in the estate of a decedent who has left no will.

INHERITANCE TAXES.—An important duty of an executor or administrator is the payment of inheritance taxes or death duties. These are taxes imposed by law on the right of a decedent to transmit or of the legatees or next of kin to receive the property of a deceased person. The nature and amount of the taxes vary in different states. In the United States there is also an **estate tax** levied by the federal government on the estate as a whole with an exemption of $50,000, allowed to residents. For the purpose of fixing these taxes the estate must be inventoried at its value as of the date of the death of the decedent. This **inventory** must include all the personal property and also all real estate within the United States. It is filed with the taxing authorities and must be satisfactory to them as to values. Both the federal and state governments appoint **official appraisers** to review the inventories and fix the taxes. The executor or administrator may not distribute any personal property until the tax thereon has been fixed and paid or provided for. In the case of **stocks in corporations,** the corporation is forbidden to transfer the stock out of the name of the decedent without the permission or "waiver" of the taxing authorities of the state in which it is incorporated as well as of the state in which the decedent was domiciled at the time of his death. Waivers will be issued by these states on the payment of the taxes, if any, which are due on the transfer of the stock. Most of the states do impose such taxes. **Income taxes** must be paid by the estate, just as by an individual, and the income tax returns filed by the decedent during his lifetime should be looked up to make sure that any additional tax liability is discovered before the settlement of the estate.

ACCOUNTING AND DISCHARGE.—After the executor or administrator has collected all the personal property and converted it into cash, has had the inheritance taxes fixed and paid, and has paid all the debts of the decedent, he proceeds to render his **account to the court** from which he derives his authority. The account must contain a full statement of all moneys and personal property which have come into the hands of the executor or administrator, all payments for funeral expenses, taxes, debts, administration expenses and legacies, all property sold or otherwise disposed of, and all profits and losses incurred in the

course of the administration, and must show the balance remaining in the hands of the accountant to be distributed to those entitled thereto. **Notice of the filing of the account** must be given to all persons interested in the estate. When the account has been approved by the court, a decree will be entered accordingly, fixing and allowing the commissions of the executor or administrator and discharging him from any further responsibility for all matters embraced in the accounting. It sometimes happens that other property is discovered after an estate has been supposedly fully administered and the executor or administrator discharged. In such a case the executor or administrator, unless his letters have been revoked, must assume charge of the **newly discovered assets** and distribute them to the persons who are entitled to receive them. The administration of an estate requires the advice of a lawyer, whose services are paid for by the estate.

Trusts

TRUSTS EXPLAINED.—A trust is the relation which exists where the **legal title to property** has been given to one person (**the trustee**) for the benefit of another (**the beneficiary**). A trust may be created to provide an income for the support of dependents, the education of children, the maintenance of charitable or educational institutions, or some other desired object. Trusts may be either express or implied. **An express trust** may be created by a deed or agreement, by a declaration or by a will. When created by a deed or a declaration, it is called a **voluntary or living trust,** as distinguished from a **testamentary trust,** which is established by a will. A living trust may begin to operate immediately under the observation of its creator, who may reserve the right to modify or revoke it if he desires. A testamentary trust takes effect upon the death of the maker of the will. **An implied trust** is a trust raised by implication of law as a result of the acts or situation of the parties.

The creator of a voluntary or living trust is called the **grantor, donor, settlor or trustor.** The creator of a trust by will—formally described as a "last will and testament"—is called the **testator.** If the trust is to continue during the beneficiary's lifetime, he may be termed a **life beneficiary,** or, if the fund consists of real estate, the **life tenant.** A person named to receive the principal when the trust terminates is called the **remainderman.**

CREATING A TRUST BY AGREEMENT (OR DEED OF TRUST).—Either real estate or personal property, or both, may be placed in a **trust fund.** Any person may set up a trust under a simple agreement which any competent lawyer can prepare, directing how the fund shall be invested, to whom income from it shall be paid, and when and to whom the principal shall be paid when the trust terminates. When a person has decided upon the amount of a trust he wishes to establish, upon its terms and conditions, and upon the person or corporation he desires to act as trustee, he should have his attorney prepare a **trust agreement** setting forth all necessary provisions. This preferably should be done in conference with the trustee, to insure that the trust is of a kind that he is willing to accept and administer. The trust agreement is signed in duplicate by both the creator of the trust and the trustee, each of whom retains one of the duplicate originals. At the same time the cash, securities or real estate which forms the subject of the trust is transferred to the trustee. This completes the transaction. The trust is in existence, and thenceforth it is the duty of the trustee faithfully to carry out the terms of the agreement.

TRUSTS UNDER WILLS.—There are various kinds of trusts under wills. Some persons, to insure to their families or others income which cannot be taken

away from them, provide for the creation of trusts in their wills. These trust funds may be in addition to bequests left outright which the beneficiaries may invest or use without restriction.

Sheltering Trusts.—It is possible, also, for a husband to provide a separate and certain income for his wife, or for parents to assure the support of their children, at the same time relieving them of the care of investments and shielding them from dangers inherent in their inexperience and the mistakes of incompetent advisers, by establishing an appropriate trust, either by agreement with the trustee during their lifetime or by a will. Trusts of this character appropriately may be called **"sheltering" trusts.**

Charitable Trusts.—Trusts for charitable, religious, educational, literary or scientific purposes may be **of perpetual duration,** with a designated institution or an indefinite number of persons constituting a class of the public as continuous beneficiaries of the income. A trust of this kind may be established for the benefit of a college, a hospital or a missionary society; to provide means of education for students; to relieve the poor of a certain community, or for a variety of other purposes similar in kind.

Insurance Trusts.—In recent years the **life insurance trust** has come into more frequent use. In this form of trust, the trust fund is provided by the proceeds of insurance policies on the life of the creator. The policies are made payable to the trustee as the beneficiary, and the proceeds are collected by the trustee when the insurance falls due, either during the lifetime of the insured, if the policies are in endowment form, or at his death, if they are ordinary life policies. In a trust of this kind the trust agreement provides for the investment of the fund, the payment of the income to the beneficiaries and the final distribution of the principal. A variation of the life insurance trust, called a **funded insurance trust,** has been extensively used in some states. In such a trust the creator deposits with the trustee, in addition to the insurance policies, securities from the income of which the insurance premiums are to be paid. In drafting an agreement for this kind of trust, care must be taken to see that it does not provide for any accumulation of income which may be unlawful in the state in which it is to be executed.

Trusts for Emergencies.—As no man with certainty can foresee all that the future may bring forth, so no one can be sure that in establishing a trust he has specifically provided for all contingencies in the lives of the beneficiaries. Provision can be made, however, for their unforeseen as well as their anticipated needs, by authorizing the trustee, in case of emergency, to make **use of principal** in addition to income, if necessary. If, for example, a man feels that the income from a trust fund, though adequate for the ordinary needs of his children, probably will be insufficient to meet the expenses of higher education which they may need, he may give the trustee discretion to use part of the principal during the years of this extra expense. Likewise, he may authorize the trustee to use part of the principal to pay for medical attendance, to defray hospital expenses or to meet other emergencies, and thus relieve his beneficiaries of anxiety under circumstances in which the income alone would be too small for their needs.

TRUSTS IN CONTEMPLATION OF DEATH.—Trusts often are created by persons who wish to dispose of part of their property while living, so that the beneficiaries can enjoy the income without the burden of management for which they may not be fitted by experience. If a trust of this kind is made "in contemplation of death," or to take effect upon the death of the maker, or if the maker retains such rights of direction and control over it as to negative the

idea that it is an absolute gift, the **trust deed** will be treated as if it were a will, and the trust fund will be subject to inheritance taxes as part of the estate of the maker. The **Federal Estate Tax Law** says that any trust or gift of this kind made within two years before the death of the creator shall be presumed to have been made in contemplation of death, and therefore shall be considered as a part of his estate for the purpose of taxation. The presumption, however, may be rebutted.

REVOCABLE AND IRREVOCABLE TRUSTS.—A voluntary trust may be either revocable or irrevocable. That is, the creator may reserve the right to revoke and terminate it at his pleasure, or he may make it an absolute, irrevocable gift. The better form to use depends upon the circumstances of each particular case. A testamentary trust cannot be revoked or changed after the testator's death.

LIMITATION TO LIVES IN BEING.—Trusts for the benefit of individuals are limited as to duration in all jurisdictions which follow the principles of the **"common law" of England,** as do most of the states of the United States. The courts of England were always opposed to tying up property for too long a time. They developed through their decisions two great rules—the **rule against perpetuities** and the **rule against restraints on alienation.** These rules are so closely related that it is hard to separate them. The common law rule against perpetuities was to the effect that a gift was void if the vesting of title was postponed for a longer time than a life or lives in being and 21 years. Nearly 100 years ago New York State cut down the limit to two lives in being and the minority of a third life. This limitation has since been adopted in many of the states in which comprehensive statutes or "codes" have been enacted declaring or abrogating or in some respects modifying the principles of the common law.

ACCUMULATION OF INCOME.—In New York, no trust may be made for the accumulation of income, except where the beneficiary is a minor. In such a case, when the beneficiary becomes 21, the accumulated income must be paid to him. In some of the other states there is no such restrictions on the accumulation of income and income which is rightfully accumulated and added to the principal loses its character as income and becomes principal.

DISCRETION VESTED IN TRUSTEE.—Trusts are sometimes established to protect inexperienced or improvident persons from the consequences of their own ignorance or extravagance. In cases of this kind, the trustee is often empowered in his own discretion either to pay the income direct to the beneficiary or to apply it for his use and support.

ASSIGNMENT OF INCOME.—In order to carry out the purpose of the donor to provide an income for the beneficiary, it is proper to include a provision in the trust that the beneficiary shall not anticipate the payment of the income, and that neither the principal nor the income shall be assigned or be liable for his debts. In some states this **restraint on the alienation of income** is provided for by statute.

INVESTMENT OF TRUST FUNDS.—It is the trustee's duty to keep all trust funds invested and he would be charged with interest for any unreasonable delay in making investments. The creator of a trust may give definite instructions as to the character of investments to be made by his trustee, or may leave this to the trustee's discretion without restrictions. Unless it clearly appears from the language used that the trustee is to be absolutely free to exercise his own judgment without limitation to the so-called **"legal" securities,** he will be restricted in his choice of investments to securities which are approved

by law as proper for trust funds. In general, these are the same that savings banks are permitted to purchase.

What kind of investments are proper for trustees varies in different states and countries, being determined in some jurisdictions by statute and in others by the decisions of the courts. For example, in **New York,** trustees who are limited to legal securities may invest only in first mortgages on unincumbered real estate to the extent of two-thirds of its appraised value, in certain first mortgage guaranteed bonds, in U. S. government bonds, New York state municipal bonds and the bonds of nearly all the other states and of most cities of the United States of more than 45,000 population. This is a good example of a jurisdiction which prescribes by statute the class of securities which trustees may purchase if they are not specifically exempted from the legal restrictions. An example of the rule in jurisdictions where the statute law does not prescribe specific classes of investment, is found in the state of **Massachusetts.** There the courts hold that in addition to such securities as are allowed to trustees in New York, a trustee may make such investments as a prudent man would make in the handling of his own funds. A leading court decision on this point (*Dickinson's Appeal*, 152 Mass. 184) says:

"Our cases, however, show that trustees in this Commonwealth are permitted to invest portions of trust funds in dividend-paying stocks and interest-bearing bonds of private business corporations, when the corporations have acquired, by reason of the amount of their property and the prudent management of their affairs, such a reputation that cautious and intelligent persons commonly invest their own money in such stocks and bonds as permanent investments."

Safety the First Consideration.—While it is the duty of a trustee to obtain in his investment of trust funds as high a rate of income for his beneficiary as he consistently can, his first consideration must be the **safety of his principal.** As, in the very nature of things, not all kinds of investments are equally sound, it is impracticable in this discussion to draw a line between securities that are good investments and those that are not good. Nevertheless, it is possible to generalize briefly on a few classifications.

Common Stocks.—Trust funds should never be risked directly in a business venture. Common stocks of corporations, therefore, are not usually considered proper trust investments.

Preferred Stocks.—Preferred stock offers better security than common stock, particularly if the corporation has no bonded debt and if the preference includes an agreement that its property shall not be mortgaged without the consent of the preferred stock.

Bonds.—A mortgage bond offers still better security, as claims of creditors come ahead of preferred stock.

Interest versus Safety.—Generally speaking, the rate of interest obtainable on an investment reflects inversely the degree of its safety, and stocks pay a higher return than mortgage bonds because of the relatively greater risk involved. Creators of voluntary trusts, however, often place certain stocks in trust, or specifically authorize their trustee to buy stocks because they believe them good investments.

Discretion of Trustees.—There seem to be sound reasons for not limiting trustees strictly to the class of investments deemed proper for savings banks. Savings banks seek to earn only a limited rate of interest for their depositors. A trustee, on the other hand, must have regard for the interests of both the life

beneficiary and the remainderman, and if he is prudent he may safely be allowed broader discretion than is given by law to savings institutions.

Dividends.—Usually, preferred stock of a corporation is entitled to dividends at a certain limited rate. The common stock receives the rest of the profits, except that part which is applied to the accumulation of a surplus for working capital or as a reserve against periods of bad business. If, for any reason, the corporation decides to distribute a part of this surplus, an extraordinary dividend is declared, either in cash or new stock. Where stock in the corporation constitutes part of a trust fund, it is not always clear whether a **dividend** of this kind is **to be treated as principal or as income.** The courts frequently have been called upon to decide this question as it has affected specific trusts. The **rule in New York** is that in the absence of provisions in the trust agreement to the contrary, ordinary cash dividends belong to the life beneficiary of the trust, and extraordinary dividends representing accumulated profits, whether distributed in cash or in the form of stock, are to be apportioned between principal and income in the proportion in which the profits distributed were earned before and after the trust was created. This rule is based on the principle that the trust fund must not be reduced below its original amount by payments out of principal to the beneficiary, and that the beneficiary must have the benefit of all the income. Sometimes, however, the creator of a trust desires not to have extraordinary stock dividends apportioned, but added to the principal, and he may provide for this in the trust instrument in the absence of any statutory prohibition. The law of the state in which the trust is to be executed should be consulted on this point.

COMMISSIONS OF TRUSTEES.—A trustee is entitled to reasonable compensation for his services. In many states this is fixed by law. In the absence of a statute the amount to be allowed would rest with the discretion of the court. The **compensation of a testamentary trustee** is fixed by law in New York and is the same as that of an executor. It is paid in the form of a commission on the sum of money or the value of the property received and disbursed, at the following rates:

5% on the first $ 2,000
2½% on the next $20,000
1½% on the next $28,000
2% on all above the first $50,000

Thus, on a trust fund of $100,000 which yields an annual income of $5,000, the commissions would be:

On Principal

On the first	$ 2,000 @	5%	$100
On the next	20,000 @	2½%	500
On the next	28,000 @	1½%	420
On the remaining	50,000 @	2%	1,000
Total estate	$100,000		
Total commission on principal			$2,020

On Income

On the first	$2,000 @	5%	$100
On the next	3,000 @	2½%	75
Annual commission on income			$175

Commissions on income are payable annually. **Commissions on principal** are payable when the trust terminates.

The **commissions on voluntary trusts** are usually fixed by the trust agreement. Generally they are about the same as those allowed by law to testamentary trustees. In voluntary trusts, it is customary to pay half of the commission on principal at the beginning of the trust and the other half at the end.

THE TRUST COMPANY OR BANK AS TRUSTEE.—In the very essence of things, the ideal trustee is a trust company or a bank authorized to do a trust business.

Perpetual Existence.—In every way, the modern trust company or bank is better equipped than the individual to handle trusts. For one thing it offers **continuous administration,** which the individual cannot do. Human life is appallingly uncertain and illness a universal heritage. No man can always be at home or in his office, and beneficiaries of trusts often have suffered as the result of delays and annoyances due to the misfortune or preoccupation of individual trustees. A corporation, on the other hand, operating under a perpetual charter, has continuous life and a permanent abiding place, and its multi-personal organization is assurance against interruption of the duties of trusteeship caused by absence, disability or death. If an individual trustee dies or resigns before the termination of the trust, a successor or substitute must be appointed. This frequently requires legal proceedings, always more or less complicated and costly. It also involves the preparation of an accounting by the former trustee or his estate. And the expenses of the accounting, as well as the legal expenses, are a charge against the principal of the trust fund. Not only do these expenses reduce the amount ultimately to be turned over to the remainderman, but the beneficiary also suffers a loss of income by the reduction of the fund, in addition to the delay and inconvenience caused by the substitution proceeding.

Financial Responsibility.—Financial strength is another quality possessed by a trust company or bank in a degree equalled by few individuals. Institutions of this kind have large resources. Their capital must be kept in high grade investments of a character prescribed by law. Their operations are constantly under supervision of the banking authorities. From this standpoint alone, they are ideal fiduciaries—guardians, executors, administrators, trustees, custodians.

Expert Service.—Few individuals are equipped to perform the varied duties and tasks which fall to the lot of a trustee. Trust companies, and banks, on the other hand, have organizations of experts trained by long experience in the handling of trusts. Knowledge of banking practice and security values, facility in solving the many problems incident to trusteeship, machinery which insures accuracy in accounting and promptness in performance—these are qualities of trust company and bank service which the public has appreciated and is rewarding by increasing patronage. Following are some of the duties which prove troublesome to an individual trustee, but which are performed by a trust company or bank as a matter of everyday routine.

Accounting.—The trust company or bank keeps accurate accounts of all its transactions affecting either principal or income.

Amortization.—It keeps the principal of the trust fund safely invested and in making payments carefully differentiates between principal and income. If, for example, bonds have been purchased at a premium above par, the entire coupon is not to be treated as income. On the contrary, a part of each coupon

is principal and should be set aside to amortize, or gradually wipe out, the premium paid within the term of the investment, unless the trust provisions expressly relieve the trustee from this obligation.

Records of Recurring Duties.—Due dates of interest, dividends and rents, and dates on which to remit income are carefully noted and rigidly observed.

Accounts for Beneficiaries.—Accounts and statements are made to beneficiaries at regular intervals, and proper vouchers are obtained for all payments.

Guardianship

APPOINTMENT OF GUARDIANS.—Parents are the natural guardians of their own children. Children under the age of 21 are known in law as **infants or minors.** In case of the death of the parents, the protection of infant children and of their property is assumed by the state through its courts. A surviving parent may appoint a guardian for infant children by will or deed, if the law of the state permits. The court will appoint a guardian of the person to control the custody of a child, and a guardian of the property to care for his estate, on proper application. A guardian appointed by will is called a **testamentary guardian.** A guardian of the person or property is called a **general guardian.** A person appointed to represent an infant in a legal proceeding is called a **special guardian** or a **guardian ad litem.** A general guardian is required to safely keep the property of his ward which comes into his hands, investing moneys in the class of securities prescribed by law, and caring properly for real estate, and to deliver it to his ward when he comes of full age.

APPLICATION OF AN INFANT'S PROPERTY.—A general guardian of an infant's property is often appointed to receive a legacy or other fund to which his ward is entitled. The income from an infant's property may be applied to his support and education when necessary, but if the infant is living with his parents and they are able to support and educate him without resort to the income from his separate estate, the guardian must accumulate the income during the minority of his ward. The safest course for the guardian to follow is to make application to the court by which he was appointed for authority before making any payments. The court may also direct the application of principal toward the support and education of an infant when the income is inadequate.

COMPENSATION AND ACCOUNTING OF A GUARDIAN.—The compensation of a general guardian is usually fixed by law. It is generally the same as that allowed to executors and testamentary trustees. The courts exercise a supervision and control over guardians whom they appoint, usually by requiring the filing of a **surety bond** for the faithful performance of their duties, and the rendering of **annual accounts** so long as the guardianship continues. When the infant attains the age of 21 years and thereby acquires all his civil rights, it is the duty of the guardian to render to the court an account of his proceedings, in substantially the same form as that required of an executor or administrator. He must produce vouchers for his expenditures and the ward must be given an opportunity to examine the account for himself. Upon the approval of this account by the court, the guardian will be judicially discharged from further responsibility.

COMMITTEE, CONSERVATOR OR GUARDIAN OF INCOMPETENT PERSONS.—Insane persons, idiots and habitual drunkards are termed in law incompetent persons and are considered to be wards of the state. The courts, on proper application, will appoint guardians of their persons and

property whose responsibilities and duties are similar to those of a general guardian of an infant. These guardians are called guardians, committees or conservators, according to the usage of the state in which they are appointed

Corporate Trusteeship

TRUSTEES UNDER CORPORATE MORTGAGES.—Corporations are creatures of the statute law and their powers are defined and limited by the law. Corporations are in general of three kinds, public, quasi-public and private. **Public corporations** are such as counties, towns and cities. **Quasi-public corporations** are operated with private capital and for profit, but for purposes in which the public has a direct interest, such as railroads and electric light, gas and water companies. **Private corporations** are such as are created for the private benefit of the collective members of the corporation to promote their financial, social or religious interests. Quasi-public corporations are subject to regulation by the state and federal governments, and can not issue stock or bonds without the approval of the local public service commission and also in the case of railroads operating in more than one state, of the federal Interstate Commerce Commission. Banks and trust companies, mortgage companies and building and loan associations, although properly classed as private corporations, are also subject to the supervision of governmental departments, because the public has such a direct and vital interest in their safe operation and solvency.

A business corporation usually has capital stock sufficient to cover its investment in plant and provide working capital for the manufacture or purchase of its stock in trade. If, as in many lines of business, it is necessary to carry a larger inventory at certain seasons of the year than the working capital will permit, a successful corporation will have no difficulty in meeting these seasonal needs by borrowing directly from banks or selling its notes in the commercial paper market. Very often, however, a corporation finds it necessary or expedient for the extension of its plant or other purposes to borrow more money than can be obtained on current loans, and believing that the sum needed can be repaid out of surplus profits over a period of years it does not desire to issue additional capital stock therefor. Under these circumstances a mortgage on the property and franchises of the corporation is the approved method of financing.

A **corporation mortgage** is exactly the same in principle as the mortgage given by one individual to another to secure a loan on the pledge of his real property. The individual mortgagor usually also gives **a bond** to repay the loan to the individual mortgagee, and the bond and mortgage may be transferred from one person to another by assignment in writing. The mortgage and any assignments are recorded in the **land records of the county** in which the real estate is situated, and when the loan is repaid a discharge or satisfaction of the mortgage is recorded in the same office.

When a corporation borrows on mortgage the amount is usually so large that no single individual is able or willing to lend it all. The bond is, therefore, divided for convenience into many small units, usually of $100, $500 or $1,000 each, and distributed, generally through the medium of private bankers or investment companies, among many investors. A single mortgage to secure all these bonds is made to a trustee or trustees. This mortgage contains **covenants and conditions** designed to protect the bondholders and define the duties and responsibilities of both the mortgagor corporation and the trustees. It is executed in two or more duplicate originals by the mortgagor corporation, and

also by the trustee or trustees to signify their acceptance of the trust. For this reason it is often called an "indenture" of mortgage; because formerly, before the practice of recording deeds was established, when a deed was executed in counterparts it was written with both parts on one sheet, which was then cut or torn apart in a notched or indented line, each party retaining one part and the indentations serving as a safeguard against substitution or forgery. A corporate mortgage is also called a deed of trust, because it is made to a trustee.

FORM AND TERMS OF CORPORATE MORTGAGE.—Corporate mortgages vary greatly in their terms, according to the character of the business of the particular corporation and the property pledged, and the ideas of the lawyers who draw the instrument. No general form can be laid down, but the following features are common to most mortgages:

1. A recital of the date of the mortgage and the names of the parties.
2. A series of clauses, each beginning with the word "whereas," reciting such matters as the draftsman of the mortgage deems essential or desirable by way of explanation or representation, to show that the mortgage and the bonds which it is given to secure have been properly executed; as for example:
   (a) That the making of the mortgage has been duly authorized by vote of the stockholders and directors, and, if necessary, by the public service or other supervisory commission.
   (b) That the board of directors has duly authorized the issuance of bonds and interest coupons in the form which is set forth in full in the mortgage.
3. A "granting clause," transferring to the trustee the mortgaged property.
4. A particular description of the property to be mortgaged, which may consist entirely of real estate or entirely of personal property or of both real and personal property.
5. A "habendum clause," beginning "to have and to hold," describing the character of the estate granted by the mortgage.
6. A declaration of trust, setting forth the precise terms on which the trustee is to hold the property for the bondholders.

The **declaration of trust** is usually divided into a number of clauses, each dealing with a particular situation. It includes the covenants of the corporation, such as to keep the mortgaged property insured, to pay taxes, and properly to maintain the value of the security; a statement of the duties and remedies of the trustee in case of default by the corporation; provision for the redemption of bonds, if that is one of the features of the mortgage; provision for the release of portions of the mortgaged property in case of sale; for the issue of additional bonds upon the acquisition of additional property or for new construction; for the registration and exchange of bonds; and any other provisions which may be appropriate to the mortgage. The trustee is usually not required to take any action in case of default by the mortgagor unless requested to do so by the holders of a certain proportion of the outstanding bonds, generally from 10% to 25%.

There are various kinds of corporate mortgages, designated according to their character and security. For example, a railroad having first mortgage bonds outstanding may subsequently build or acquire other lines, and put out an issue of **"first and refunding mortgage" bonds,** which are a first lien on the new lines and a second lien on the old property, with a provision for the refunding or exchange of the first mortgage bonds for those of the new first and refunding issue. When all the first mortgage bonds have been thus refunded the new

mortgage becomes an absolute first mortgage on all the property. When the property pledged under a mortgage consists wholly or in part of the stock or bonds of another corporation owned by the mortgagor company the mortgage may be called a **collateral trust mortgage** or **a real estate and collateral trust mortgage.**

EQUIPMENT TRUST NOTES.—The equipment trust note is a modern form of corporate obligation **issued generally by railroad companies or tank car companies** on the security of railroad cars or locomotives. The indenture under which the notes are issued has many of the features of a corporate mortgage, but usually is not a mortgage in form but an **agreement of conditional sale and indenture of lease.** Under such an agreement, title to the equipment which is to be the basis of the notes is transferred to the trustee by vendors who have acquired or have contracted to acquire the railroad equipment from the manufacturers for the corporation which is to issue the notes, and the equipment is then leased by the trustee to the corporation issuing the equipment trust notes. Equipment trust notes are usually issued in bearer form like ordinary corporation mortgage bonds and are made **payable serially,** that is, a certain amount fall due at intervals of six months or a year, so that the last note will be paid off before the equipment is likely to be worn out.

FORM OF CORPORATE BONDS OR NOTES.—The bonds issued under corporate mortgages may be made with interest coupons attached, both bond and coupons being payable to bearer, or in registered form, like certificates of stock, payable only to the registered owner, to whom interest is paid by check mailed as it becomes due. The bonds are engraved or printed and are impressed with the corporate seal and signed by the proper officers of the corporation. Each bond also bears a certificate signed by the trustee that it is one of the series of bonds referred to in the mortgage therein mentioned. The attached interest coupons bear the engraved signature of the treasurer or secretary of the corporation. While no two bonds are exactly alike, the one shown on the accompanying page is a good example of the general form of a corporation mortgage bond.

To adapt this bond form to individual requirements, the following or other insertions may be made:

In case only part of the property is to be mortgaged in place of descriptive clause, insert: "The certain real estate and personal property of said The Commerce & Railway Co. mentioned or described, etc."

If a sinking fund is desired, insert: "This bond is entitled to the benefits of a Sinking Fund to be maintained by The Commerce & Railway Co. and used as provided in the said mortgage."

If right of redemption before due date is desired, insert: "This bond is redeemable at the option of The Commerce & Railway Co., its successors or assigns, on any day on which interest is payable hereunder on and after January 1st, 1925, at 105% of its par and accrued interest, on the conditions and in the manner provided in said mortgage."

The words "or hereafter acquired by it" appearing in the third paragraph of the foregoing bond form may be omitted.

REORGANIZATIONS.—In case a corporation fails to pay the interest or principal of its bonds when due, the trustee may bring an action in the courts for the **foreclosure of the mortgage,** in accordance with the provisions of the mortgage. It is not required to do so except when requested by the bondholders and satisfactorily indemnified for its expenses. The usual procedure upon default is for some of the bondholders to organize a **protective committee.** The

THE COMMERCE & RAILWAY COMPANY

FIRST MORTGAGE 5% GOLD BOND

FOR VALUE RECEIVED, The Commerce & Railway Company, promises to pay to the bearer, or, if this bond be registered, to the registered holder hereof, on the 1st day of January, 1930, the sum of ONE THOUSAND DOLLARS, and to pay interest thereon from the 1st day of January, 1910, at the rate of five per centum per annum, payable semi-annually on the 1st day of January and July in each year until said principal sum shall be fully paid, upon presentation and surrender of the interest coupons hereto annexed as the same become due respectively.

Both principal and interest of this bond are payable in gold coin of the United States of America, of, or equal to the present standard weight and fineness, at the office of the Columbia Trust Company in the City of New York, free of tax in the United States.

This bond is one of a series of 500 bonds of said The Commerce & Railway Company of like amount, tenor and date, amounting in the aggregate to the sum of $500,000. numbered consecutively from 1 to 500, both inclusive, all of which bonds are equally secured by a first mortgage or deed of trust bearing date the 1st day of January, 1910, made and executed by said The Commerce & Railway Company to the Columbia Trust Company, as Trustee, of and upon all the real and personal property of said The Commerce & Railway Company now owned or hereafter acquired by it as mentioned or described in said mortgage, subject to the terms and conditions of which mortgage this bond is issued and held.

This bond may be registered in the manner and with the effect provided in said mortgage.

This bond shall not be valid or obligatory until the certificate endorsed hereon shall be signed by the Trustee under said mortgage.

IN WITNESS WHEREOF, said The Commerce & Railway Company has caused this bond to be signed in its corporate name by its President and its corporate seal to be hereto affixed and attested by its Secretary, and the interest coupons hereto attached to bear thereon the fac-simile of the signature of its Treasurer, as of the 1st day of January, 1910.

Form of Corporate Bond

committee appoints counsel and selects a trust company or bank, or sometimes a private banking house, to act as its depositary. The committee then by advertisement in the newspapers and circularization of the bondholders who are known to it invites deposits of the bonds with the depositary, which issues **negotiable receipts** therefor. After a careful study of the situation the committee prepares a **plan of reorganization** and submits it to the bondholders. Any depositing bondholder who is not satisfied with the plan may withdraw his bonds within a certain time on payment of his pro rata share of the expense incurred by the committee.

The plan of reorganization often involves the **formation of a new corporation** to take over the property and business of the defaulting company by purchase at foreclosure sale, and the issuance of new securities in exchange for the defaulted bonds. Since the new securities will all go to the depositing bondholders, and those who do not deposit their bonds with the committee can get only their proportionate share of the cash realized in the foreclosure, which is usually a small sum, it is generally advantageous for all the bondholders to join in such a reorganization.

Corporate Agency

TRANSFER AGENT.—Trust companies and banks are commonly used as agents for corporations in connection with the **issuance of capital stock.** They act as transfer agents and registrars. It is the duty of a transfer agent to keep the stock certificate books and stock ledgers, to issue the original certificates, and when certificates are presented for transfer to cancel the surrendered certificates and issue new ones in the names of the transferees. It is customary for the corporation to furnish the transfer agent with stock certificates signed in blank by the proper officers and sealed with the corporate seal, so that the issue of new certificates need not be delayed by the necessity of getting them separately executed each time. The certificates are not valid until they have been countersigned by the transfer agent, so that there is no danger of overissue in thus signing in blank.

When a certificate of stock is presented for transfer the owner must sign **the assignment, or power of attorney** to transfer it, which is printed on the back of the certificate, or a detached power of like form which may be attached to the certificate. The signature to this power must correspond in every particular with the name as written on the face of the certificate. It should be witnessed or guaranteed in accordance with the rules of the transfer agent, which are usually those of the stock exchange of the city in which the agent is located, and are designed to give assurance of the genuineness of the signature. If the certificate is in the name of a deceased person or of an executor, trustee, guardian or other fiduciary, it must be accompanied by documents showing the authority of the fiduciary to make the transfer. In the case of stock standing in the name of a deceased person, this would include the waiver or consent of the taxing authorities of the states which are entitled to collect inheritance taxes on the decedent's estate.

The assignment or power of attorney to transfer contains a blank line for the insertion of the name and address of the person to whom the stock is to be transferred. If this is not filled in, the certificate is said to be **endorsed in blank,** or to be in bearer form, and its ownership may pass from one person to another by delivery until a name is inserted in the blank.

It is also the duty of the transfer agent to prepare and furnish to the corporation from time to time **lists of the stockholders** for use in voting at meetings and in the payment of dividends. The preparation of these lists is facilitated

by the modern method of keeping the names and addresses of stockholders on addressograph stencils arranged in alphabetical order ready for duplication at any time. Some corporations transfer their stock in their own offices, appointing an employee to act as transfer agent, but if the stock is listed on a stock exchange, it must also be registered and countersigned by a trust company or bank. This requirement is a safeguard against erroneous or fraudulent overissue.

When a stock is actively dealt in in more than one city, a transfer office is usually maintained in each city. Each transfer agent reports daily to the other the transfers it has made, furnishing copies of transfer sheets from which postings are made to the stock ledgers. If a certificate of stock is lost or destroyed it is customary to issue a new one to the stockholder upon his filing a bond of a satisfactory surety company in an amount acceptable to the transfer agent—usually double the market value of the stock—indemnifying the corporation as well as the transfer agent and the registrar.

REGISTRAR.—The danger of an overissue of stock through carelessness or fraud and the possibility of the forgery of stock certificates has brought about the almost universal custom of having stock certificates registered by a trust company or bank. Most of the stock exchanges require that listed stocks shall be registered, and make it a rule that a trust company or other agency shall not at the same time act as both transfer agent and registrar for the same corporation. When a registrar is appointed, it is furnished with a list of the stockholders, showing the number of shares held by each. As new certificates are presented for registration old ones for the same number of shares must be presented canceled to be marked off of the registrar's list. Thus no more than the total number of authorized outstanding shares can be registered. The duties of the registrar do not require it to pass upon the sufficiency of the transfer, which is a responsibility of the transfer agent. When stock is actively dealt in in more than one city, a registry office is usually maintained in each city, and each registrar reports daily to the other the registrations it has made.

DIVIDEND DISBURSING AGENT.—The transfer agent of a corporation's stock is often appointed also as its dividend disbursing agent because of the convenience and economy of this arrangement. In all large companies dividends are paid at regular periods, usually quarterly or semiannually, by checks to the order of the registered stockholders mailed to their addresses or pursuant to their recorded instructions. The checks are written up by machine from the addressograph stencils maintained by the registrar, and the amounts are filled in with a check writing machine. Envelopes are addressed by the use of the same stencils, or a still further economy of time and labor is secured by using "window" envelopes which have an open or transparent space that fits over the name and address as printed on the checks. An agent which disburses dividends for many companies can perform this service usually at a much smaller expense than the corporations acting separately would have to incur. The procedure is for the corporation to notify its dividend disbursing agent of the declaration of the dividend and deposit with it the amount to be paid out, with instructions to prepare and mail checks to stockholders of record as of the date on which the dividend is declared payable. The checks are imprinted with the name of the corporation but are signed by the disbursing agent.

COUPON-PAYING AGENT.—Interest on bearer bonds of corporations is represented by coupons which must be detached by the bondholder and presented for payment to the corporation or its fiscal agent. As a convenience to bondholders a trust company or bank is usually designated as paying agent.

The bondholder encloses the coupons in an envelope which his bank will provide and deposits them for collection like a check. In certain cases they must be accompanied by **income tax ownership certificates.** When the coupon paying agent has paid the coupons, they are canceled and returned to the corporation. They may then either be pasted in coupon books for preservation until the maturity of the mortgage, or destroyed by representatives of the company and of the trustee of the bond issue, acting jointly, after notation of their payment has been made on the books of the trustee. This last point is important, because when the mortgage falls due and the bonds are paid or refunded the trustee will require the production of all paid coupons or evidence of their payment and destruction before it will satisfy the mortgage of record, as the mortgage is given to secure both the principal and the interest of the bonds.

FISCAL AGENT.—Another function of the coupon-paying agent usually is to withhold any income taxes which the corporation is required to withhold or pay, and to file with the U. S. Internal Revenue Department the monthly and annual reports of coupons paid and taxes collected which the law requires of corporations. This, however, necessitates the formal designation of the coupon-paying agent by the board of directors of the corporation as its fiscal agent, with authority to withhold any required income tax and pay it over to the government and to make and file the statutory reports.

ESCROW AGENT.—Trust companies and banks are often made agents or depositaries under escrow agreements. The word "escrow" means scroll or writing. It has come to have a technical legal meaning, and is used to describe an agreement under which a deed or other thing of value is deposited with a third person for delivery to another, usually the grantee, on some condition. For example, A sells some stock to B, to be paid for in instalments and delivered upon the final payment. A endorses the stock in blank and delivers it to a trust company or bank with a letter in which both he and B join, directing it to hold the stock until B has paid to it for account of A the amount agreed upon, within a certain time, or if the full payment shall not be made, to return the stock to A, or make such other disposition of it and of any partial payments as A and B may agree upon by the letter and direct.

CUSTODIAN OF SECURITIES.—Trust companies and banks are admirably adapted to act as custodian of securities for religious, charitable or educational institutions, whose treasurers are usually honorary officers serving without compensation and who do not wish to maintain in their own offices expert financial assistance. Many such organizations have by action of their boards of directors appointed a responsible bank or trust company as custodian or assistant treasurer, and turned over to it all the investments of the organization for safekeeping and to be dealt with as the board or its authorized officers or committees may from time to time direct.

Voting Trusts

VOTING TRUSTS.—The voting trust is a device in corporate management which consists in the transfer of at least a majority of the stock of a corporation to trustees, usually three or five in number, to be voted as the trustees deem best for a period of years, in order to perpetuate a management or policy which is believed to be for the best interest of the corporation. An **agreement** is drawn up by the terms of which any other stockholders may also deposit their stock thereunder. The duration of a voting trust is often limited by law. In

New York this limit is ten years. The holders of the stock transferred receive **voting trust certificates** instead of their stock certificates. The voting trust certificates are traded in and transferred in exactly the same manner as stock certificates. The **voting trustees** must provide some agency to receive the stock and issue the voting trust certificates in their behalf, and it is customary to appoint a trust company or bank to act as such agent and depositary.

The following is a typical voting trust certificate:

BLANK PETROLEUM CORPORATION

No..... .....Shares

INCORPORATED UNDER THE LAWS OF THE STATE OF WEST VIRGINIA

COMMON STOCK TRUST CERTIFICATE

THIS IS TO CERTIFY that as hereinafter provided, on surrender hereof and upon payment, if the Voting Trustees shall so require, of a sum sufficient to reimburse them for any stamp tax or other governmental charge in connection with such delivery,..... .....will be entitled to receive a certificate or certificates expressed to be fully paid for.....shares of the par value of $100 each, in the Common Capital Stock of the Blank Petroleum Corporation; and, in the meantime, to receive payments equal to the dividends, if any, collected by the undersigned Depositary upon a like number of such shares standing in its name as agent of the Voting Trustees, such dividends, if received by the Depositary in stock of said Corporation, to be payable in trust certificates.

This certificate is issued pursuant to, and is subject to the terms and conditions of, a certain Agreement lodged with the Depositary, dated October, 1912, between owners of common stock in Blank Petroleum Corporation and the undersigned Voting Trustees and Depositary. No stock certificate shall be due or deliverable hereunder before October 1, 1917, unless the Voting Trustees, in their unrestricted discretion, shall determine to authorize such delivery prior to said date as in said Agreement provided. Until the actual transfer of such stock certificates to the registered owner hereof, the Voting Trustees, singly or collectively as in said Agreement provided, shall possess and be entitled in their discretion to exercise, in respect of any and all such stock, through the Depositary, all rights of every name and nature including the right to vote thereon for every purpose and to consent to any corporate act of said corporation as provided in said Agreement, it being expressly stipulated that no voting right passes by or under this certificate, or by or under any agreement express or implied.

This certificate is transferable at the office of the Depositary for the time being under said Agreement, on surrender hereof by the registered holder in person or by attorney duly authorized, in accordance with the rules from time to time established by the Voting Trustees, and, until so transferred, the Voting Trustees and the Depositary may treat the registered holder as the owner of this certificate for all purposes whatsoever.

This certificate is not valid unless signed on behalf of the Voting Trustees by the Depositary for the time being under said Agreement as their agent, and also registered by the Registrar for the time being under said Agreement.

IN WITNESS WHEREOF, the said Voting Trustees have caused this certificate to be signed on their behalf by the Depositary, their duly authorized agent for that purpose, this..... day of....., 19....

Receivers

RECEIVER.—When a corporation becomes insolvent, the directors, bondholders or general creditors may petition the court to appoint a receiver of the assets of the corporation. A receiver may also be appointed on the petition of a stockholder, if the directors are wasting or misapplying the property or funds of the corporation. The receiver is the **representative of the court,** and as such supersedes the board of directors in the management of the corporation. It is his duty to take full charge of the business and carry it on under the direction of the court until it is reorganized or liquidated. He is required to give a bond for the faithful performance of his duties and his compensation is fixed by the court and payable out of the earnings or assets of the corporation.

SECTION 32

FEDERAL TAXES

SCOPE AND TREATMENT.—In this section will be found an outline of practice and procedure relating to the following taxes: the federal income tax, the federal estate tax, the federal capital stock tax, and miscellaneous federal taxes. While the principles enumerated regarding the various federal taxes will apply under any revenue act, modifications in certain respects will become necessary as new laws go into effect. Reference should therefore be made in all cases to the current revenue act to ascertain changes since the publication of this Handbook. This is particularly true as to rates of tax and computations. The statements contained herein are based on the 1924 Revenue Act. Limitation of space and the general principles governing the compilation of handbooks prevent discussion of details or of controversial points. This section can act only as a general guide and not as an exhaustive reference book. Readers who require a full and complete treatment of the subject should refer to the current edition of **Montgomery's Income Tax Procedure.** It will also be useful to have the **Internal Revenue Bulletins** and the **Reports of the United States Board of Tax Appeals** (both issued by the Government Printing Office, Washington, D. C.). **Loose-leaf services** covering federal taxes are published by Corporation Trust Co. and by Prentice-Hall, Inc., both of New York.

FEDERAL INCOME TAX

General Survey of Federal Income Tax Laws

The taxation of income by the Federal Government can be said to have commenced with the **ratification of the Sixteenth Amendment to the Constitution** by the necessary number of states on February 25, 1913. An income tax was imposed during the Civil War but was repealed thereafter. Another law was passed in 1894 but was held to be unconstitutional. Because of this decision an amendment to the Constitution was necessary before Congress could impose an income tax without apportionment among the states. **March 1, 1913,** is usually referred to as the **basic date** since which Congress had the power to tax income without apportionment.

CORPORATION EXCISE TAX LAW OF 1909.—The 1909 excise tax law imposed a **1% tax on the net income of corporations.** Although the law was based on cash receipts and disbursements, the Treasury interpreted it so that net income could be determined on the accrual basis. A credit of $5,000 was allowed. Interest deductible was limited to that paid on an amount of indebtedness not exceeding the paid up capital stock. This law continued in **effect until February 28, 1913.** No deduction was permitted for depletion.

1913 LAW.—This law was the first of the modern federal income tax laws in this country. On **corporate incomes** the rate of tax was 1%, no specific exemption being allowed. For **individuals** a normal tax of 1% was applied, together with a **surtax** beginning at 1% on net incomes over $20,000 up to 6% on incomes over $500,000. The personal exemptions were $3,000 for single persons and $4,000 for a married couple. Losses were deductible by individuals only when incurred in trade or when arising from casualties. **Depletion** was restricted to 5% of the value of the output. **Interest** was deductible only on indebtedness not in excess of one-half of the sum of paid-up capital stock and interest-bearing indebtedness. **Dividends received by corporations** were taxable even if derived from wholly owned subsidiaries. Corporations were allowed to use a fiscal year basis of reporting if notice of intention to do so was filed within a specified period. This law was **effective until December 31, 1915.**

1916 LAW.—This law was the earliest of the war measures. The rate of tax was raised to 2% for **corporations** (no exemption), while **individuals** were subjected to a normal tax of 2% as well as to surtaxes on incomes over $20,000, ranging from 1 to 13%. The personal exemption for the purpose of the normal tax was $3,000 for single persons and $4,000 for husband and wife. The basic date for computing profit on sales of property and depreciation was fixed at March 1, 1913. The deduction for losses was liberalized to some extent and the earlier limitation on depletion eliminated. Provisions in the law taxing stock dividends and life insurance proceeds received by corporate beneficiaries were subsequently held invalid. This law continued **in effect until December 31, 1917.**

1917 LAW.—In order to raise additional revenue after our entry into the World War, the 1917 law was passed as an amendment to the 1916 law. During the year 1917 there were, therefore, **two laws in effect,** with consequent complications. An **additional normal tax** of 2% was imposed on individuals (except on incomes between $1,000 and $2,000 on which the tax was only 2%) and an additional tax of 4% was imposed on corporations. **Surtaxes** were imposed (in addition to those under the 1916 law) on individual incomes over $5,000 ranging from 1 to 50%. For the purpose of the 1917 tax computations the personal exemption of husband and wife was reduced to $2,000, and that of single persons to $1,000; a credit of $200 was allowed for each dependent. In computing the 4% tax on corporations, dividends received were excluded. While deductions for **contributions to charities,** etc., were permitted up to 15% of the net income, the deduction of income and excess profits taxes was not allowed, nor was interest paid to purchase and carry tax exempt securities allowed as a deduction.

The 1917 law also imposed an **excess profits tax** on individuals, partnerships and corporations. Individuals deriving their income from personal services were subject to a tax of 8% with an exemption of $6,000. Domestic partnerships or corporations without invested capital, or with only a nominal capital, were also subject to the 8% tax, the exemption being $6,000 for partnerships and $3,000 for corporations. Other corporations and partnerships were subject to excess profits taxes ranging from 20 to 60% of net income, dependent on the amount of invested capital and pre-war earnings. This law was **in effect for the calendar year 1917.**

1918 LAW.—Although not passed until February, 1919, this law was **effective retroactively to January 1, 1918.** As a law it was complete in itself and replaced the 1916 and 1917 laws which were operative concurrently throughout 1917. The need for increased revenue resulted in higher tax rates. The **normal tax**

rate for the year 1918 was 12% on individuals and corporations with a reduction to 6% on the first $4,000 of taxable income for individuals who were citizens or residents of this country. For the years 1919 and 1920 the normal tax for individuals was 8% (4% on the first $4,000 of taxable income for citizens or residents), while that for corporations was reduced to 10%. The **surtax rate** for individuals having incomes in excess of $5,000 ranged from 1 to 65%. On **corporations** (but not on partnerships) an excess and war profits tax with brackets of 30, 60 and 80% was imposed for 1918 and with brackets of 20 and 40% for 1919 and 1920, a credit, computed on invested capital, or in some cases on pre-war earnings, being allowed. A special class of personal service corporations was provided under the 1918 law which included corporations whose income was ascribed mainly to the activities of the principal stockholders and in which capital was not a material income-producing factor. Such corporations were treated in a way similar to partnerships for tax purposes.

Returns had to be made on the basis of the taxpayer's accounting period; individual deductions for losses were again liberalized; consolidated returns were required in the case of affiliated corporations; depreciation and depletion allowances were more liberal than theretofore; the arbitrary limitation on interest deductions by corporations was eliminated; dividends received by corporations were wholly exempted from normal tax; a deduction for amortization of war facilities was introduced; credits were allowed for income and profits taxes paid to foreign governments; and a specific credit of $2,000 was allowed to corporations for the purpose of the income tax; the personal exemptions remained the same as under the 1917 law.

Although the law provided otherwise, the Supreme Court of the United States decided that the profits on the sale of property acquired before March 1, 1913 was to be based on cost or March 1, 1913 value, whichever was higher, while deductible losses were to be determined on whichever basis was lower. If the selling price fell between cost and March 1, 1913 value, no taxable gain or deductible loss arose.

1921 LAW.—For most purposes the 1921 law, which was signed November 23, 1921, was effective from January 1, 1921. However, the excess profits tax was continued only for 1921, and at the same rates as were imposed by the 1918 law for 1919 and 1920. Effective January 1, 1922, the income tax on corporations was increased to 12½%, the excess profits tax being no longer in effect. At the same time the surtax scale affecting individuals was changed so as to make the maximum surtax 50%; surtaxes began at $6,000, instead of $5,000 as theretofore.

Another radical change effective January 1, 1922, was that the **profits from the sale or exchange of property held for profit or investment** (excluding stock in trade and property held for personal use) for two years or over, termed capital gains, were taxable at 12½% instead of being subject to the ordinary normal and surtaxes. Capital losses, however, were deductible at the highest surtax rates.

Other changes effective January 1, 1921, were: The personal exemption of husband and wife was raised to $2,500 if the net income did not exceed $5,000; the credit for dependents was raised to $400; the establishment of a "readily realizable market value" was made the criterion of taxability in exchanges of property; the reorganization provisions were liberalized; business losses could be carried forward and applied against income of the two succeeding years; the basis to be used in the case of sale of property acquired by gift was to be that which would have been used by the donor; the deduction of losses through

so-called "wash" sales was disallowed; additions to reserves for bad debts were permitted as deductions; interest was to be paid by the Treasury on taxes refunded to the taxpayers; returns were to be filed whenever an individual's gross income exceeded $5,000 independent of his or her net income; the limitation period for additional assessment was changed and a provision was inserted allowing binding agreements between taxpayers and the Commissioner to prevent reopening of tax returns. By amendments of March 4, 1923, the period for filing 1917 refund claims was extended, and certain classes of exchanges previously non-taxable were thereafter considered as closed transactions.

1924 LAW.—With the exception of a 25% reduction in tax payable for the year 1923, the 1924 law was effective from January 1, 1924 although not signed by the President until June 2, 1924. The **normal tax rate** for individuals was reduced to 6% (except that the first $4,000 of taxable income was taxed at 2% and the second $4,000 at 4%), but the **corporation tax rate** remained at 12½%. The **surtax rates** on individual incomes began at 1% on net incomes over $10,000 and rose to 40% on incomes over $500,000. A slight change was made in the personal exemptions so that no reduction from $2,500 to $2,000 was required when incomes exceeded $5,000. Income arising from personal services up to a maximum of $10,000 was taxed 25% less than income arising from other sources.

The general basis for computing the profit or loss on the sale of property acquired before March 1, 1913, was changed so that the taxable gain or deductible loss was predicated on cost or March 1, 1913 value, whichever was higher. Extensive changes were also made in regard to the closed transaction; gain or loss was to be recognized in all cases other than those expressly excepted. The reorganization sections were liberalized in some respects but the benefit gained by reorganizations under the 1918 and 1921 laws which resulted in higher bases for depreciation, depletion, etc., was nullified.

The definition of capital assets was modified so as to include property held for personal use. Capital gains were still taxed at 12½% but capital losses could not reduce the tax liability by more than 12½%. Estates and trusts were considered as subject to tax in all cases, deductions, however, being allowed for income which was properly distributed or distributable. The income of revocable and insurance trusts was taxed to the grantor.

A quasi-judicial tribunal, the **United States Board of Tax Appeals,** was set up under the 1924 law to which taxpayers might appeal against additional assessments proposed by the Treasury before the payment of the tax was actually made. As a result of this provision much of the hardship which arose from erroneous assessments under earlier laws was removed.

Changes were also made in the statutory period during which assessments could be made, also during which claims for refund could be filed by taxpayers. If, for 1917, a waiver, permitting the assessment of tax after the expiration of the statutory period was filed within 5 years of the due date of the return for that year, or if a waiver for 1918 was filed on or before June 15, 1924, claims for refund or credit could be filed on or before April 1, 1925. By amendments of March 3, 1925, the filing of waivers for 1919 before June 15, 1925, extended the time in which claims for refund or credit could be filed until April 1, 1926. It was also provided in all of the above cases that the filing of a further waiver before the expiration of the original waiver would extend the period for filing claims for refund and credit to April 1, 1926, for the years 1917 and 1918, and to April 1, 1927, for the year 1919.

Definitions

The following definitions apply specifically to the federal income tax law.

PERSON.—Under the law, the term "person" means an individual, an estate or trust, a partnership or a corporation. Any person subject to tax is considered as a taxpayer.

INDIVIDUALS.—Within the category of individuals come citizens of the United States, resident or non-resident, aliens and fiduciaries. Under certain conditions minors are recognized as individuals. A "head of a family" is an individual who actually supports in one household, one or more individuals closely connected with him or her by blood relationship, relationship by marriage or by adoption and who has the right to exercise family control over such dependents. A legal guardian is not *per se* the head of a family. A resident alien cannot qualify as head of a family unless his dependents live with him in this country.

ESTATES AND TRUSTS.—The classification **"fiduciary"** includes guardians trustees, executors, administrators, receivers, conservators, or any persons acting in a fiduciary capacity. A fiduciary differs from an agent in that a position of peculiar confidence is implied in the former capacity. The status of a trust or estate depends upon the laws of the country under which it arises, and has nothing to do with the citizenship of the fiduciary. Special rules are applicable to estates and trusts having non-resident alien beneficiaries. **Business trusts** of the "operating" type are taxed as associations, while **"holding trusts"** are usually treated as other trusteeships.

PARTNERSHIPS.—A domestic partnership is one organized or created in the United States, including only the states, the District of Columbia, Alaska or Hawaii. All others are foreign. **Joint adventures** are not usually considered to be partnerships unless the usual legal attributes of partnership exist. **Stock syndicates** are held to be joint adventures and not partnerships. **Limited partnerships,** which under state laws contain one or more general partners whose liability is unlimited, are treated as true partnerships; those which consist entirely of members whose liability is limited are treated as corporations for tax purposes.

CORPORATIONS.—Under the law the term "corporation" includes associations, joint-stock companies and insurance companies. Organizations which act or do business in an organized capacity, however created, are treated as corporations if the earnings are distributed on the basis of shareholdings or capital invested. The transferability of membership interests without the consent of the other members and the conduct of business by others than members are indications of associations and differentiate them from partnerships.

Returns

Under the law the Commissioner of Internal Revenue may require any returns necessary and may prescribe all needful rules and regulations. Taxpayers must keep such records (including inventory records where such are necessary to determine income) as will enable the Treasury to verify the accuracy of returns made by taxpayers.

FORMS USED.—The forms in commonest use are designated as follows:

1040	Individual tax return, net income over $5,000, calendar year basis.
1040 FY	Similar but for fiscal years.

1040 A	Individual tax return, net income less than $5,000.
1040 B	Individual tax return, non-resident alien.
1120	Corporation tax return, calendar year.
1120 A	Similar but for fiscal years.
1120 T	Tentative corporation tax return.
1126	Inventory certificate.
1065	Partnership return, calendar year.
1065 A	Similar but for fiscal years.
1041	Fiduciary return.
843	Claim for abatement, refund or credit.
1000	Ownership certificate—tax paid at source.
1001	Ownership certificate—tax not paid at source.
1096	Summary form for use with 1099.
1097	Information return of dividends paid by corporations.
1099	Information return of salaries, interest, etc., paid.
1116	Claim for foreign tax credit—Individuals.
1118	Claim for foreign tax credit—Corporations.

These forms can be obtained from local collectors of internal revenue.

PERIOD COVERED.—Returns are usually made for a "taxable year" which cannot exceed 12 months. A **"taxable year"** means the calendar year or a fiscal year ended therein. A **fiscal year** is a period of 12 months ending on the last day of any month except December. Commencing with 1924 the term "taxable year" specifically included a fractional part of year for which a return might be required under certain circumstances.

All taxpayers may keep their accounts on a fiscal year basis, and if they so keep their books, their returns must be on the same basis. If no books are kept, the calendar year basis must be used in all cases. A newly organized business may select the basis upon which to keep its books. This decision will control the basis of its returns. No notice to the Commissioner is required in such cases as the first return will be sufficient indication.

If taxpayers desire to change from the calendar year basis to a fiscal year basis, or vice versa, or from one fiscal year to another, application must be made to the Commissioner on form 1128 at least 30 days before the end of the proposed period for which a return would be required to effect the change and the reasons for the desired permission stated. If the application is granted, the new basis must be used in subsequent returns. A return must be filed for the fractional period intervening between the end of the last taxable year and the beginning of the next taxable year.

TIME FOR FILING.—Returns on forms 1040, 1120, 1065 and 1041 (and their modifications) are required to be filed on or before the 15th day of the 3rd month following the end of the taxable year—March 15, if the calendar year basis is used. If the designated day falls on Sunday or on a legal holiday, the returns are due on the following day. A corporation which has been dissolved, may file its return immediately or wait until the end of its taxable year. The latter is usually more advantageous.

Extensions of time for filing returns can be granted only by the Commissioner upon application showing a reasonable cause filed before the prescribed due date. Usually the Commissioner requires the filing of a tentative return (merely showing estimated tax due) on the usual due date and the payment of one quarter of the tax shown thereon to be due. No extension may exceed 6 months, except for taxpayers who are abroad. Local collectors of internal revenue cannot grant extensions for any reason.

PLACE OF FILING.—Returns are filed with the collector of internal revenue for the district in which the taxpayer's legal residence or principal place of

business is situated. If a taxpayer has no legal residence or place of business in the United States, returns are sent to the Collector at Baltimore, Md. The various information returns are filed with the Commissioner of Internal Revenue, Washington, D. C.

If returns are not filed in person, they may be mailed, on condition that they are placed in the mails in sufficient time to reach the collector on or before the due date. Postage is required to be prepaid.

INDIVIDUAL RETURNS—WHO SHALL MAKE RETURNS.—Returns on form 1040 or its modifications are required from—

1. Individuals having a net income for the taxable year of $1,000 or over if single, or not living with husband or wife.
2. Individuals whose net income is $2,500 or over if married and living with husband or wife.
3. Individuals whose gross income is $5,000 or over, quite independent of the amount of net income or whether any tax is due.

The fact that an individual is the head of a family or has dependents does not affect his liability to render returns. If a husband and wife have a net income of $2,500 or over, or a gross income of $5,000 or over, the income of both may be included in a joint return, or they may make separate returns of their individual incomes. Personal exemptions, credit for dependents, dividends, etc., are not considered in ascertaining liability for filing tax returns.

If a taxpayer is unable to make his own return, such return may be made by a duly authorized agent or by a fiduciary.

All income tax returns must be verified by oath or affidavit before any officer authorized to administer oaths under federal or state laws. The acknowledgment should not be made before a notary who has any interest in the preparation or filing of the returns.

Separate Returns of Husband and Wife.—Although in many cases joint returns are filed, it may be advantageous in some cases to file separate returns. An election as to whether a joint return or separate returns are filed is only binding for the year in question and does not affect a taxpayer's action in subsequent years.

Separate returns are usually desirable when each spouse has a substantial income. Surtaxes are thereby reduced and the full advantage obtained of the lower normal tax brackets. The most advantageous division of the personal exemption should be used.

Joint returns should be filed where one spouse has a loss which may be offset against the other's income; where one spouse has charitable contributions in excess of 15% of net income while the other has not exceeded his 15% allowance; where the credit due one spouse for tax paid at source or foreign taxes exceed the tax liability of that spouse, and where the excess credit can be absorbed by the other spouse; and where full advantage of the exemption from normal tax on dividends, etc., cannot be obtained in separate returns, due to losses or other deductions.

From a practical viewpoint the best method of ascertaining whether joint or separate returns should be filed is to compute the tax on each basis with varied allocations of personal exemptions and then file returns on the basis which shows the least combined tax.

Minors.—Individuals under the statutory age of majority must file returns if they have a net income of $1,000 or over, if single, $2,500 or over if married or if their gross income exceeds $5,000. Unless a minor has been emancipated by his parent, his earnings from personal services must be included in the

parent's return, no return being required from the minor. Such compensation is not considered as income to the minor. If the minor's income is from property, such income is not included in the parent's return, but a separate return must be made by the minor (or someone acting for him as agent, guardian, or trustee) if the income exceeds the statutory exemptions.

Community Property.—Community income as defined by the laws of Texas, Washington, Arizona, Idaho, New Mexico, Louisiana and Nevada (but not California) may be equally divided between husband and wife in separate returns.

CORPORATION RETURNS.—All corporations, except those specifically exempted from tax, must file returns, regardless of the amount of their gross or net income. Such returns must be filed upon the same basis, fiscal or calendar year, as the corporation's books are kept. The returns must be sworn to by the president, vice-president or other principal officer, and by the treasurer or assistant treasurer. When only one officer is available, he will sign for the other in the latter's official capacity.

Inactive, dissolved and incomplete corporations raise questions sometimes difficult of solution. The general rule is that if a corporation has the right to continue to function as such under the laws of the state in which incorporated, whether or not it has received income, returns must be filed. The dissolution of a corporation before the passage of a new law applicable to any part of the period before dissolution, does not relieve the corporation from the necessity of filing returns under such subsequently enacted statute. **Holding companies** even though receiving no income other than dividends, must file returns unless specifically exempted from tax under the law.

When a **foreign corporation** has income from sources within the United States as defined in the statute, but has no office in this country, the requisite returns must be filed by its agent in this country. When **receivers, trustees in bankruptcy or assignees** are operating the property or business of corporations, they will make returns in the same manner and form as corporations are required to do. This is also true in the case of trustees in dissolution. A receiver in charge of only part of a corporation's property (e.g., in mortgage foreclosure proceedings) will not file a return for the corporation.

With their returns, corporations must submit such a statement as will enable the Commissioner to determine the portion of the earnings or profits accumulated during the taxable year which have been distributed or ordered to be distributed to its shareholders.

Affiliated Corporations.—Two or more domestic corporations are deemed affiliated under the law if one corporation owns at least 95% of the voting stock of the other or others, or if at least 95% of the voting stock of two or more corporations is owned by the same interests. Foreign corporations are excluded, as are those organized under the China Trade Act, 1922, and those whose income arises mainly in United States possessions. The phrase "same interests" means the same individual(s), partnership(s) or corporation(s). Where there is more than one owner, the percentage of ownership is required to be substantially the same in each corporation. The status of a corporation as regards affiliation is not changed by the fact of a receivership.

Consolidated returns may be filed by affiliated corporations at their option, but an election made for 1924 will be binding for subsequent years unless permission to change is obtained from the Commissioner. The advantages of consolidated returns are that intercompany transactions can be made without affecting taxable income and that losses of one or more corporations can be

offset with full effect against profits of others. However, only one specific credit of $2,000 is allowed to the affiliated group, independent of the number of corporations affiliated. The fiscal years of all affiliated corporations must be made to correspond with that of the principal company. Where a change in the affiliation status occurs during the taxable year, separate returns must be made for the non-affiliated corporations for the period during which they are not affiliated.

The consolidated return is filed with the collector of the district in which the principal reporting company has its principal office. Each of the other affiliated corporations files an information return, form 1122, with its respective collector. The tax will be assessed against the respective corporations in any way agreed upon among them. Under certain conditions the Commissioner may consolidate the accounts of any related trades or businesses (incorporated or unincorporated, and whether organized in this country or not) in order to make an accurate apportionment of gains, profits, income, deductions or capital between them. This provision does not relate to the payment of taxes but to the determination of income, etc.

PARTNERSHIP RETURNS.—Partnerships (except those which are classified as corporations for federal tax purposes) are **not taxed as entities,** but the members thereof are individually taxable on their distributive shares of the partnership income. However, every partnership is required to file a return on form 1065 or variant thereof, in which is given the data necessary for the determination of the shares of the individual members. This return must be sworn to by one of the partners. The partnership return contains the usual items of income and corresponding deductions, except that no deduction is allowed for contributions. Interest on U. S. obligations whenever issued is excluded. The net income so determined is then allocated to each partner in such a way as to show separately each individual's share of dividends, earned income, capital net gain or loss, income tax paid at the source, and income and profits taxes paid to foreign countries. A statement of the principal of non-taxable securities and interest thereon is also required.

If the fiscal year of the partnership falls partly within a calendar year to which the provisions of one law apply and partly within a year to which the provisions of a succeeding law apply, the income taxable for each period must be segregated. A special form (1065 A) is usually provided for such cases.

This return is filed with the collector for the district in which is located the principal office of the partnership not later than March 15, in the case of partnerships reporting on a calendar year basis, or not later than the 15th day of the third month following the close of the fiscal year in other cases. When changes occur in the membership of firms during the year, such changes are to be reported in the next return filed. Frequently there is no necessity for filing separate returns for the old and new partnerships, but it is sometimes convenient to do so. **Receivers for partnerships** file the ordinary partnership return.

FIDUCIARY RETURNS.—The fiduciary, or at least one of joint fiduciaries, **in charge of the income of an individual,** makes a return of income on behalf of that individual in the same way and under the same conditions as the individual would file such returns were his income not under the charge of the fiduciary. The fiduciary **in charge of an estate or trust** makes a return for such estate or trust if the net income thereof is $1,000 or over, or if the gross income is $5,000 or over, regardless of the amount of net income, or if any beneficiary is a non-resident alien. The appropriate returns are filed, at the time prescribed for the filing of individual tax returns, with the collector of

the district where the fiduciary resides. Form 1040 and/or 1041 are used for returns by fiduciaries. A consideration of the statutory definition of the net income of estates and trusts is necessary to determine which returns are required to be filed in any particular case.

Net Income of Estates.—The net income of estates is determined in the same manner as for individual taxpayers, with the following exceptions:

1. In lieu of the deduction for contributions allowed to individuals, which is limited in amount, estates and trusts may deduct any amount which is, in accordance with the will or deed of trust, paid or set aside for purposes enumerated in the deductible contributions section of the law (see Deductions for Contributions, page 1605) or is to be used exclusively for religious, charitable, scientific, literary or educational purposes, or for the prevention of cruelty to children or animals, etc.

2. As an additional deduction there is allowed the amount of income of the estate or trust distributed currently to beneficiaries and the amount of income collected by a guardian to be held or distributed under court order.

3. In the case of estates during the period of administration, there may be deducted the amount of income properly paid or credited during the taxable year to any legatee, heir or beneficiary.

The trustee under the following conditions will exclude certain income from the return, since under the law such income is to be taxed to the grantor:

1. Where the grantor of a trust has, at any time during the taxable year, either alone or in conjunction with any person not a beneficiary of the trust, the power to revest in himself title to any part of the corpus of the trust, then the income from such part of the trust shall be included in the return of the grantor.

2. Where any part of the income of a trust may, in the discretion of the grantor, either alone or in conjunction with any person not a beneficiary of the trust, be distributed to the grantor or be held or accumulated for future distribution to him, such part of the income of the trust shall be included in the return of the grantor.

3. Where any part of the income of a trust is or may be applied to the payment of premiums on insurance policies on the grantor's life (unless the proceeds of the policies are irrevocably payable to those organizations to which contributions are deductible by individuals), such part of the income of the trust shall be included in the return of the grantor.

Trusts created by employers as part of a stock bonus or profit-sharing scheme are not taxable as such. However, the participants are taxed on the excess of withdrawals over their personal contributions to the trust.

Use of Forms 1040 and 1041 by Fiduciaries.—If a **trust or estate** has a net income as defined by statute for trusts and estates and outlined in the foregoing paragraphs, form 1040 must be used and the tax shown thereon paid by the fiduciary. If the trust or estate has no net income as defined by statute, or if amounts have been distributed to beneficiaries, or if the income of the trust is by statute taxable to the grantor, form 1041 must be filed. Thus in some cases both 1040 and 1041 will be required.

Description of Form 1041.—This form provides for the usual items of income and deductions, and for a statement of principal of and interest on non-taxable securities. However, all interest on United States obligations is excluded from gross income. A schedule showing the beneficiaries' names and addresses together with their respective shares of the net income (allocated so as to indicate separately dividends, capital net gain or loss, income tax paid at

source and income and profits taxes paid to foreign countries) is required. A trust or estate cannot have "earned" income. If part of the income remains undistributed by the fiduciary or is taxable to the grantor, such amounts will appear in the schedule of beneficiaries' shares as taxable to the fiduciary and grantor respectively. The amounts shown in the schedule of beneficiaries' shares should agree with the corresponding items included in the beneficiaries' personal returns.

Returns where Two or More Trusts.—If the same fiduciary is in charge of more than one trust, all created by the same person, the trustee may make one return on form 1041 for them all. If the trustee is in charge of several trusts created by different persons, then a separate return on form 1041 is required for each trust.

Non-resident Alien Beneficiaries.—If a citizen or resident fiduciary has charge of an estate or trust with one or more non-resident alien beneficiaries, form 1040 B must be filed for each such beneficiary and the tax paid as shown thereby, unless any such beneficiary has appointed an agent in the United States to act for him in this matter. Form 1041 is required in addition unless the sole beneficiary of the trust or estate is a non-resident alien when form 1040 B alone will suffice.

TENTATIVE RETURNS.—When an extension of time is granted by the Commissioner for the filing of a return, a so-called tentative return is usually required. Such tentative return is made on the kind of form which will be used for the final return and merely indicates the name and address of the taxpayer and the amount of tax estimated to be due. The word "Tentative" should be plainly written on the front of the return. The **first payment of tax** is based upon the tentative return, adjustment being made when the final and complete return is later filed. Tentative returns are not accepted unless **permission to file them** has been granted by the Commissioner, usually as a condition precedent to extensions. The final and complete return is filed within the period of the extension granted.

A tentative return must be distinguished from an incomplete or imperfect return. The latter cannot be accepted by the Commissioner. If at the due date and after no further extension can be granted, it is still impossible to prepare a complete return, due to lack of data, etc., a return should be prepared in the best way possible under the circumstances. This will not be considered as incomplete, since it is the best that can be produced at the time. When full information is available an amended return should be filed, if any material discrepancy has become manifest.

AMENDED RETURNS.—When it is discovered that a return already filed is erroneous to a material extent, the circumstances should be disclosed in a letter to the Commissioner. If so desired, permission to file an amended return may be requested. However, there are **reasons against the filing of amended returns,** and, in consequence, it is recommended that material changes be reported in letter form with a recomputation of the tax due. Any additional tax need not be paid until demanded. Cases may arise where the changes to be made are so complex that the only satisfactory remedy is to file complete amended returns.

Income

GENERAL.—**Income** is defined by the regulations as "the gain derived from capital, from labor, or from both combined, provided it be understood to include profit gained through a sale or conversion of capital assets." **Net**

income is defined by the law as meaning gross income (excluding non-taxable income) less allowable deductions (including statutory net losses). Such net income will be determined in accordance with the method of accounting regularly employed by the taxpayer if such method, in the opinion of the Commissioner, correctly reflects the income. Taxpayers must keep such records as will enable the Commissioner to verify the amount and method of computation of net income. Where the production, purchase or sale of merchandise is involved, **inventories** at the beginning and end of the taxable year are necessary to compute net income. **Expenditures for capital assets** which have a life beyond the year must be capitalized and not charged to expense. **Renewals** must be charged against depreciation reserves.

CASH OR ACCRUAL METHOD.—If the first of these two methods correctly reflects income, a taxpayer may report income as received and claim deductions as paid, independent of the time of accrual or incurring respectively. This method is called the "cash," "cash receipts and disbursements" or "receipts" method and is largely employed by taxpayers whose income arises from salaries, wages, dividends, interest, etc.

The **accrual method** considers that income is realized whenever a right of action arises or when the income accrues. Expenses are deductible when the liability is incurred. The time of receipt or payment of cash is not a determining factor. For example, an individual sells property on December 30 but is paid therefor on February 2 of the following year. Under the accrual method the income arose on December 30, but under the cash method not until February 2. Similarly, the individual incurs a liability or some expense on November 20 and pays the bill therefor on January 12. Under the accrual method, the expense is considered to have arisen on November 20, but under the cash method on January 12. Again, interest accrued but unpaid at the end of the taxpayer's year is taken into consideration under the accrual method, but under the cash method is not considered until actually received or paid.

Taxpayers may use either the cash or accrual method but not a mixture of both. A merchant whose business requires the use of inventories cannot consistently use the cash method; the use of inventories demands the accrual method. A salesman, however, can use either method since his income is chiefly from compensation for personal services. A taxpayer desiring to report on the accrual basis **must keep books of account,** since the accrual of income and the incurring of liabilities could not be verified otherwise without considerable trouble. Whenever the phrases "paid or incurred" or "paid or accrued" appear in the law, they are to be interpreted in accordance with the accounting method used by the taxpayer.

CHANGE OF METHOD.—Since a change from the cash to accrual method, or vice versa, may result in part of taxpayer's income escaping tax or in deductions being taken twice, such a change may only be made with the permission of the Commissioner. **Application to change** must be made at least 30 days before the close of the period covered by the return. Such application is to be accompanied by a statement showing the classes of items differently treated under each system and specifying all amounts which would be duplicated or entirely omitted as a result of the change. The Commissioner will not grant permission to change the method of reporting if there is no other reason than the reduction of tax liability. Amended returns for past years on the new basis to equalize the adjustment are sometimes required.

CONSTRUCTIVE RECEIPT.—A taxpayer is deemed to have received items of income which have been **credited to or set apart for him without restriction.**

Thus, taxpayers are considered to have received interest when coupons have matured (except in case of default) but have not been collected by the taxpayer. Interest on savings bank deposits becomes income when credited. Dividends on corporate stock are considered as income when unqualifiedly subject to the stockholders' demand. (In practice this means the date of receipt by stockholders.) The distributive shares of partnership profits is considered as income to the members as soon as determined, even though not actually distributed. Where a sale is made or services performed by one person on the understanding that payment is to be made to a third person, the profit or income will be considered as constructively received by the seller or person performing the services. The 2% tax paid by the obligor under a tax-free covenant bond is not constructive income to the bondholder.

PERIOD FOR WHICH INCOME IS COMPUTED.—Net income is computed on the basis of the **taxpayer's annual accounting period.** Usually that period is 12 months. If the taxpayer keeps no books, the calendar year is used as a basis for his return. Books must be kept before a fiscal year basis can be claimed. The time as of which items of income or deductions are to be accounted for depends on the **fundamental rule** that the method used must clearly reflect the taxpayer's income. Each return is supposed to be complete in itself. There is a proper time at which income is considered to arise and at which deductions are to be taken. Deductions not taken in the proper year cannot be taken in some succeeding year. This rule is not strictly followed in large and complicated businesses, since there are always overlapping items of income and deductions.

The period in which income is deemed to arise or in which deductions must be taken is often a matter of discussion. As a general rule, the year of determination governs. Claims for compensation under government contracts constitute income for the year of allowance or determination. Bad debts charged off and subsequently recovered are income for the year of recovery. An award under a workmen's compensation act is deductible in full in the year the award is made. A loss from theft or embezzlement is deductible in the year sustained. The **fundamental question** is: When must the item of income or deductions be included or allowed under good accounting practice? The consensus of opinion among accountants whose experience gives them the right to speak with authority is the controlling factor.

EXEMPT INCOME.—Certain classes of income are by statute excluded from gross income and, hence, are not subject to tax. There are also certain classes of income exempted from taxation by fundamental law. Both of these categories will be considered here. Income which becomes exempt from tax by virtue of the personal exemptions or credits is discussed later.

Life Insurance Proceeds Received by Insured.—The amount received by an insured under life insurance, endowment or annuity contracts up to the aggregate of premiums paid by him is excluded from gross income. Any **excess of receipts over premiums** paid is taxable upon the same basis as any other gain.

Property Acquired by Gift, Bequest, etc.—The value of property acquired by gift, bequest, devise or descent is exempt from tax. Income subsequently received from such property is taxable. Gain or loss to the donee may also subsequently arise when such property is sold. A gift is a voluntary transfer of property without consideration. Many so-called gifts are in reality compensation for services rendered and as such are taxable to the recipients. Thus, **Christmas gifts or bonuses to employees** are generally taxable to the recipients. Pensions paid for prior services rendered by the recipients are

taxable; if paid to one who has rendered no service, a pension is a gift and exempt from tax. A bonus paid by a state or the federal government for war service is exempt.

Interest on State or Municipal Securities.—The interest on obligations of states, territories or political subdivisions thereof, or of the District of Columbia, are excluded from gross income. A statement of the principal of and interest on such securities has to be made in the return if the taxpayer has other income. Generally speaking, the interest on obligations of states and municipalities is exempt from federal income tax. If any taxpayer is not certain as to the status of a particular security, inquiry should be made of the Treasury Department. When **municipal securities** which were issued at a discount are redeemed, the difference between the redemption price and the "basis" to the holder is exempt from tax, to an amount not exceeding the original discount. Thus, if municipal bonds were issued at 94 and retained by the original owner until redemption at 100, the discount of 6 points will be entirely exempt from tax. If part of the same issue of bonds is purchased by another owner at 90 and held to redemption, only 6 points are exempt from tax. **Interest on awards by cities and states,** as for example, in condemnation proceedings, is tax exempt, since such awards are obligations of the cities or states in question.

Interest on Federal Farm Loan Act Securities.—Interest on bonds of Joint Stock Land banks is exempt, as is that on Farm Loan bonds or debentures issued by Federal Intermediate Credit banks. Interest on promissory notes secured by first mortgages to Federal Land banks, Intermediate Credit banks or Joint Stock Land banks is also exempt.

Interest on United States Obligations.—Interest on all the **pre-war bonds** of the United States or its possessions is exempt from federal income tax. Interest on 3½% **Liberty bonds** is also entirely exempt. The interest on **other Liberty bonds** and on other United States obligations issued after September 1, 1917, is free from normal tax and is free from surtax to a limited extent. The taxability of such interest is treated hereinafter under "Income from Liberty bonds." Interest on **postal savings accounts** is exempt.

Income of Foreign Governments.—Income received by foreign governments from investments in domestic securities or interest on bank deposits so received or from any other source in the United States is exempt from tax. The privilege is extended to **foreign ambassadors,** ministers and their households, except that income from any business carried on by them is taxable. **Foreign consuls** and employees are exempt from tax on their fees and salaries if their country allows a similar exemption to American consuls.

Accident or Health Insurance or Compensation.—Amounts received by the insured or his estate or other beneficiaries arising out of accident or health insurance or workmen's compensation acts as compensation for personal injuries or sickness are exempt from tax. Any damages received by suit or otherwise in respect of such injury or sickness is likewise exempt.

Income Derived by States, Etc.—Income derived from the exercise of any essential governmental function or from any public utility by any state, territory or political subdivision thereof, or income of any possession of the United States or subdivision thereof, is exempt from tax. The law makes special provision for dealing with the income of utilities with which states, etc., entered into contracts before September 8, 1916, and should be consulted when occasion arises.

Income from Foreign Ships.—The income of a non-resident individual or foreign corporation which arises exclusively from the operation of ships documented under the laws of a foreign country granting a similar exemption to United States citizens and corporations, is exempt. A list of the foreign countries satisfying this requirement appears in the regulations.

War Risk Insurance, Pensions, Etc.—Amounts received as compensation, family allotments and allowances under the War Risk Insurance and Vocational Rehabilitation Acts or World War Veterans' Act, 1924, or as pensions from the United States for service of the beneficiary or another in the military or naval forces of the United States in time of war, or as a state pension for services rendered by the beneficiary or another, are exempt. Pensions paid by the United States not as the result of war service are taxable.

Building and Loan Association Interest.—The amount received by individuals before January 1, 1927, as dividends or interest from building and loan associations, substantially all the business of which is confined to making loans to members, is excluded from gross income up to a maximum of $300 in any year. Each member of a partnership is entitled to the full exemption of $300 in his individual return.

Minister's House.—The rental value of a dwelling house and appurtenances furnished to an ordained minister is excluded from his income. This does not apply to an allowance made in lieu of a house.

Shipowners' Indemnity Associations.—The receipts of shipowners' mutual protective and indemnity associations, not organized for profit, if no part of the net earnings inures to any private shareholder, is exempt from tax, except that tax is payable on net income from interest, dividends and rent.

China Trade Act Dividends.—Dividends received by a citizen of China, resident therein, from a corporation organized under the China Trade Act 1922, if he is the equitable owner of the stock in such corporation, are exempt from tax.

OTHER EXEMPT INCOME.—The exemptions outlined above arise from specific provisions of the revenue act. Certain other income is exempted because of specific statutory provisions or in accordance with fundamental law.

Salary of the President and Federal Judges.—The salary of the President of the United States and of federal judges is now held to be exempt from taxation. The **salaries of other federal officers and employees** are subject to tax.

Salaries of State Employees.—Compensation paid officers and employees of states or political subdivisions thereof is not subject to tax. The fees of notaries public and the commissions of receivers appointed by state courts are exempt. A distinction is drawn between officers and employees of states and persons appointed for occasional temporary or limited duties. The compensation of the latter class of persons is taxable. Since the District of Columbia, Alaska and Hawaii are not states, employees thereof are subject to tax.

Federal Reserve Bank Dividends.—Dividends received on the stock of Federal Reserve banks by member banks are exempt.

Compensation for Personal Injury.—Compensation for injury to personal or family rights, such as alienation of affection, slander, libel or surrender of right to custody of a minor child, is exempt from tax. Neither alimony nor separation allowances are taxable. Damages for breach of promise are taxable.

Income Accrued Prior to March 1, 1913.—Any claim existing unconditionally on March 1, 1913, and then owned by a taxpayer and all interest accrued thereon prior to that date are exempt from tax whenever received. Interest

accrued prior to March 1, 1913, but received thereafter, is also exempt. Payments received after March 1, 1913, for services rendered prior thereto and for which a claim existed at that date, do not constitute taxable income.

EXEMPT CORPORATIONS.—Certain classes of corporations are specifically exempted from income tax by statute. In order to establish exemption and thus be relieved of the duty of filing income tax returns and of paying the tax, every organization which claims exemption must **file with the local collector an affidavit** showing its character, its purposes, its actual activities, the sources and disposition of its income, and whether any part thereof may inure to the benefit of any private shareholder or individual. A copy of the charter or articles of incorporation, the by-laws, the latest balance sheet and profit and loss statement are required. Certain additional information is required in some cases; details will be found in the current regulations. After the Commissioner has granted exemption, the organization need file no income tax returns unless the character or purposes of the organization change so as to make it subject to tax.

Classifications.—The following summarizes the classes of exempt corporations. For further details the current regulations should be consulted.

1. Labor, agricultural, or horticultural organizations.
2. Mutual savings banks not having a capital stock represented by shares.
3. Fraternal beneficiary societies, orders, or associations, (a) operating under the lodge system or for the exclusive benefit of the members of a fraternity itself operating under the lodge system; and (b) providing for the payment of life, sick, accident, or other benefits to the members of such society, order or association or their dependents.
4. Domestic building and loan associations substantially all the business of which is confined to making loans to members; and cooperative banks without capital stock organized and operated for mutual purposes and without profit.
5. Cemetery companies owned and operated exclusively for the benefit of their members or which are not operated for profit; and any corporation chartered solely for burial purposes as a cemetery corporation and not permitted by its charter to engage in any business not necessarily incident to that purpose, no part of the net earnings of which inures to the benefit of any private shareholder or individual.
6. Corporations, and any community chest, fund, or foundation organized and operated exclusively for religious, charitable, scientific, literary, or educational purposes, or for the prevention of cruelty to children or animals, no part of the net earnings of which inures to the benefit of any private shareholder or individual.
7. Business leagues, chambers of commerce, or boards of trade, not organized for profit and no part of the net earnings of which inures to the benefit of any private shareholder or individual.
8. Civic leagues or organizations not organized for profit but operated exclusively for the promotion of social welfare, or local associations of employees, the membership of which is limited to the employees of a designated person or persons in a particular municipality, and the net earnings of which are devoted exclusively to charitable, educational, or recreational purposes.
9. Clubs organized and operated exclusively for pleasure, recreation, and other non-profitable purposes, no part of the net earnings of which inures to the benefit of any private shareholder.

10. Benevolent life insurance associations of a purely local character; farmers' or other mutual hail, cyclone, casualty, or fire insurance companies, mutual ditch or irrigation companies, mutual or cooperative telephone companies, or like organizations; but only if 85% or more of the income consists of amounts collected from members for the sole purpose of meeting losses and expenses.
11. Farmers', fruit growers', or like associations, organized and operated as sales agents for the purpose of marketing the products of members and turning back to them the proceeds of sales, less the necessary selling expenses, on the basis of the quantity of produce furnished by them, or organized and operated as purchasing agents for the purpose of purchasing supplies and equipment for the use of members and turning over such supplies and equipment to such members at actual cost, plus necessary expenses.
12. Corporations organized for the exclusive purpose of holding title to property, collecting income therefrom, and turning over the entire amount thereof, less expenses, to an organization which itself is exempt from the tax imposed by this title.
13. Federal Land banks, national farm-loan associations and Federal Intermediate Credit banks, as provided in the Federal Farm Loan Act, as amended.

Income From Personal Services

With the exception of certain classes of income considered as exempt (see Exempt Income) the law taxes "income derived from salaries, wages, or compensation for personal service . . . . of whatever kind and in whatever form paid, or from professions, vocations . . . ." In general, compensation for personal services by whatever name called is taxable to the recipient. Thus bonuses, Christmas gifts and pensions paid by employers are usually taxable unless the elements of a true gift are present—a voluntary transfer without consideration. Prizes in newspaper contests represent taxable income. Tips and gratuities are usually taxable to the recipients. Fees paid to the clergy for marriages, baptisms, etc., are taxable to them. Commissions paid salesmen, and compensation on the basis of a percentage of profits are subject to tax. Such compensation will be returned as taxable in the year received, if the taxpayer is on the cash basis, or in the year of accrual or determination if the taxpayer is on the accrual basis.

Compensation Paid Otherwise Than in Cash.—Compensation need not be paid solely in cash to be taxable. The law taxes compensation "in whatever form paid." Payments made by employers for the benefit of employees or privileges granted employees may represent taxable income. Payment for services may be made in property of various kinds. The fair value of such property constitutes income from personal services.

Payments in Property.—Compensation paid in **stock of a corporation** represents income to the extent of the fair market value of such stock when available to the employee. If the stock has no determinable market value, no income will be reported until the recipient sells the stock. When **notes or other evidences of indebtedness** are received in payment, the fair discounted value at time of receipt is income to the recipient. The discount will be taken up as income when the obligation is met. If the notes could not be discounted except at a substantial loss, no immediate income is returned but the entire proceeds when collected will be taxable. If **board and quarters** are provided

by an employer, their fair value represents income to the employee, unless such provision is made for the convenience of the employer and the employee has no option in the matter. Allowances for meals and lodging ordinarily represent income to the employee. The value of services furnished employees, use of automobiles, heat and light, telephone, etc., represent taxable income to them.

Compensation Constructively Received.—Payments made by employers on behalf of employees represent constructive income to the employees. Examples are tuition fees, insurance premiums (other than group insurance) and allowances on the purchase price of stock. Deductions made from compensation for pension funds must be included in income by employees.

EARNED INCOME.—The 1924 law introduced a differentiation for taxation purposes between "earned" income as defined therein and other income. The necessary computations resulting from this classification will be discussed hereinafter under "Credits." Earned income means wages, salaries, professional fees and amounts received as compensation for **personal services actually rendered,** but excludes any compensation which represents a distribution of the earnings or profits of a corporation. In the case of a taxpayer engaged in a business in which both personal service and capital are material income producing factors, the earned income cannot exceed 20% of his share of the profits. This limitation applies also to partnerships whose business is of a similar character. The limitation does not apply to professional partnerships where capital is not a material income-producing factor. Estates and trusts cannot have earned income. To arrive at the **"earned net income,"** a deduction is made for expenses properly allocable to or chargeable against earned income. In no case may the earned net income exceed $10,000. If a taxpayer's net income from any source is not more than $5,000, the whole amount is considered as earned. Even if the taxpayer's net income exceeds $5,000, the amount considered as earned cannot be less than $5,000. Partnership returns are designed to show the earned net income applicable to each member thereof.

Income From Business

A separate schedule is provided on all returns for the computation of income from business. This schedule provides for the use of inventories where necessary to arrive at the cost of sales. The subject of inventories is treated later. Generally speaking, the determination of **gross income in a business** is not difficult since the problem is chiefly that of ascertaining the net sales. In the case of the sale of real and personal property on the instalment plan and in the case of long-term contracts, certain peculiar features are encountered which will be discussed separately later. In a few cases it is important to determine when the income from sales arises, but the only difficult problems of business income relate to income other than from sales.

When Does Income Arise?—When goods are exported against drafts, income does not usually arise until the drafts are accepted or the purchase price paid. Goods sent out on consignment do not produce taxable income until the consignee actually sells the goods. In the case of conditional sales, income arises when title passes. If the proceeds of sale are placed in escrow, income does not arise until there is a release to the seller.

Long-Term Contracts.—Such contracts are those for building, installation or construction covering a **period of more than one year.** Such contractor may report income on one of two bases:

1. Gross income may be reported in the year of completion. All expenditures applicable to the contract whenever incurred will then be deducted in the same year, allowance being made for inventories, etc.

2. Gross income may be reported upon the basis of percentage of completion of the contract. Deductions are allowed for expenses paid or incurred each year, adjustments being made for inventories, etc.

Other Taxable Business Income.—Taxes paid by the vendor for the vendee, forfeited stock subscriptions, land donated by Chamber of Commerce, have been held by the Treasury to be taxable. The courts have held, in one case, that a subsidy to a railroad did not constitute taxable income to the railroad.

Non-Taxable Business Income.—The following classes of income are not considered taxable: Intercompany or interdepartmental profits, voluntary assessments paid by stockholders, proceeds of business life insurance policies, cash discounts on capital expenditures, profit on sale of corporation's own stock.

Purchase of Own Bonds at Discount.—The Treasury holds that when a corporation purchases its own **bonds** at less than the issue price plus any discount amortized to date, and retires them, a profit is realized. It is also held that when a creditor forgives and cancels an indebtedness without desiring to benefit the debtor, taxable income to the debtor arises. The question of whether income arises from the **liquidation of a liability for less than its book value** is now before the courts.

Foreign Exchange.—The **current assets of a foreign branch** should be inventoried at the rate of exchange on the last day of the year. **Capital assets** are valued at the rates prevailing when acquired. Remittances are allowed for at the rate prevailing when transmitted. The Treasury publishes the rates to be used at the end of each calendar year; rates for other dates must be obtained from reliable sources.

Inventories

GENERAL.—Whenever the Commissioner considers the use of inventories necessary to determine net income, such inventories shall be taken on the basis prescribed by the Commissioner. Inventories must be taken as of one date for an entire business. **Book inventories** may be used if periodical tests show them to be reasonably accurate. Businesses requiring the purchase and sale of, or trading in merchandise, must generally use inventories. In addition, dealers in securities, in foreign exchange, in second hand automobiles, as well as farmers and cotton planters, may use inventories. **Dealers in real estate** are not permitted to use inventories. Inventories include all finished goods, partly finished goods, raw materials and supplies, the title to which was vested in the taxpayer at the inventory date. Goods in transit will be included by the purchaser if title has passed from the vendor. Bailees will not inventory the property of others in their custody. C.O.D. shipments are included in the inventory if not accepted and paid for by the purchaser at the inventory date.

VALUATION OF INVENTORIES.—Inventories are, in general, valued on one of three bases:

1. Cost
2. Cost or market whichever is lower
3. Market

The first two methods are applicable to ordinary businesses, while the **third applies only to dealers in securities,** giving this class of business a third choice of method. For the year 1920 taxpayers were given an option to select either the cost, or cost or market method. The election made in that year is binding for all years thereafter unless permission to change the basis has been granted by the Commissioner. Permission to change is granted upon application if a reasonable cause is shown.

The Treasury regulations do not permit the use of the following inventory methods:

1. Deduction of a reserve for price changes or for estimated depreciation.
2. Valuation of any part of the inventory at a nominal price or at less than its proper value.
3. Omission of portions of stock on hand, unless obsolete or unsalable.
4. Use of a constant price or nominal value for so-called normal quantity of material.
5. Inclusion of merchandise the title to which has not vested in the taxpayer.

INVENTORIES AT COST.—Cost means—

1. The inventory price of goods on hand at the beginning of the year.
2. The invoice price, less trade discounts, of merchandise purchased, plus transportation and other charges incurred in acquiring possession.
3. The cost of raw materials and supplies consumed in manufacturing by the taxpayer plus direct labor plus overhead properly applied. Interest on investment may not be included, nor may selling expenses.

Where a taxpayer produces by a single process or series of processes a product of several grades or sizes, an allocation of cost on the basis of selling values may be used. In the **tobacco industry** an average cost method is permitted, although this privilege is not extended to other industries, as for example, grain.

INVENTORIES AT MARKET.—Market means the **current bid price** prevailing at the inventory date for the particular merchandise in the volume usually purchased by the taxpayer. If no open market exists, or if quotations are nominal, the best available evidence must be relied on. If the taxpayer has offered merchandise for sale below the current market, such offered price less selling expenses may be used for inventory purposes. The Treasury holds that goods on hand or in production for firm sales contracts must be valued at cost.

COST OR MARKET.—If the basis of cost or market, whichever is lower, is used, each item must be priced at cost and market, and the lower value for each separate item included in the inventory. The basis does not mean that the whole inventory is to be priced at cost, then at market and the lower of the two totals used; each item on the inventory is valued separately.

OBSOLETE, DAMAGED GOODS.—Allowances must be made in inventory valuations for obsolete, unsalable or damaged stock. Excessive quantities, too, may warrant a special valuation. The burden of proof of the valuation is on the taxpayer. Valuations, however, are not generally questioned unless some suspicious circumstances indicate the necessity for investigation.

RETAIL METHOD.—Certain merchants, chiefly dry goods stores, are allowed to use the so-called retail method. This method is based upon the retail selling price, adjustments being made which are supposed to reduce the inventory to cost or market, whichever is lower. The Treasury rulings should be consulted for details of the method.

FUTURES.—The Treasury permits the inventorying of such futures as constitute hedges against actual spot or cash transactions.

INVENTORY CERTIFICATE.—In all cases where inventories are used, form 1126 must be filed. This form calls for certificates as to the method employed in taking and pricing the inventory.

Sale of Property on Instalment Plan

FOUR TYPES OF SALES RECOGNIZED.—Special privileges are accorded to vendors of personal and real property under certain types of contracts providing for payments in instalments. The Treasury recognizes **four types of sales:** (1) for cash; (2) on personal credit; (3) initial cash payment not exceeding 25% of the sales price, the balance being payable in numerous comparatively small payments; (4) initial cash payment exceeding 25% of the sales price, the balance being payable in any way agreed by the parties to the contract. Sales in class (3) are considered as on the **instalment plan;** those in class (4) as involving **deferred payments.** These two classes of sales will be considered in order.

INSTALMENT PLAN DEFINED.—The regulations consider as instalment sales those "in which the initial payment is relatively small (generally less than one-fourth of the purchase price) and the deferred payments numerous and of small amount." The conditions governing the passing of the title are not considered, since it makes no difference as far as income tax is concerned whether title passes immediately to the vendee or if it remains in the vendor until all or a specified part of the purchase price is paid. The instalment plan applies to sales of both real and personal property. It is largely used by vendors of real estate, furniture, phonographs, pianos, radio sets, etc. It cannot generally be used by automobile dealers, since in the sales of automobiles, an initial payment of at least 30% is required (but see Deferred Payment Sales).

COMPUTATION OF TAXABLE INCOME.—If the vendor so desires, he may return for taxation the full profit on the transaction in the year in which consummated. No taxable income will then arise when the instalments are collected. If he wishes to take advantage of the instalment plan, the income to be returned by him will be that proportion of each instalment payment which the gross profit to be realized when the property is paid for bears to the gross contract price. Thus it is necessary to ascertain the percentage which the gross profit for each year bears to the instalment sales in that year. By applying this percentage to the cash collections on account of such instalment sales (the collections on account of each year's sales being considered separately) the gross profit to be returned each year is ascertained. Cash collections on instalment sales consummated before the taxpayer commences to use the instalment plan for computing taxable income are not considered in these computations, since the gross profit on the sale has been previously reported.

As an **illustration** of the method of computation consider the following:

	Collections made during 1926	(a) Instalment Sales Contracts (sales made during respective years)	Cost of goods Sold in Respective Years	(b) Unrealized Profits on Instalment Sales Contracts	Per Cent Gross Profit Ratio of (b) to (a)
Applicable to 1925.....	$ 2,000	$30,000	$24,000	$ 6,000	20%
Applicable to 1926.....	8,000	50,000	37,500	12,500	25%
	$10,000	$80,000	$61,500	$18,500	

To ascertain the gross profit considered as realized in 1926, apply the percentages to the collections:

1925, 20% of $2,000	$ 400
1926, 25% of $8,000	2,000
Realized gross profit, 1926	$2,400

When the instalment sales are made, the gross profit is credited to an unrealized gross profit account. From this account there is transferred to earned surplus year by year the realized gross profit computed as above. The accounting records must be kept in such a way as to indicate clearly the computation of realized gross profit. Unless this is done, the use of the instalment plan may be denied.

DEFAULTED CONTRACTS.—If the purchaser defaults in the payment of his instalments, and the seller repossesses the property, the seller will return as income in the year of repossession the entire amount received on instalment payments, less the profits thereon already returned. The **property repossessed** must be included in the inventory at original cost to the vendor less depreciation and damage, if any, which means market value.

TREATMENT OF EXPENSES.—The instalment plan applies only to the computation of gross income from instalment sales. Although it would seem logical to defer in a similar way at least part of the expenses incurred in making such sales, such a procedure is not permitted. All expenses must be deducted in the year of payment or when the liability is incurred, dependent on whether the cash or accrual method is used. Any statutory net losses arising from this procedure may be carried forward in the ordinary way. (See Deductions for Net Losses, page 1601.)

Board of Tax Appeals not in Agreement.—The United States Board of Tax Appeals in its rulings up to the present time has held as invalid the method prescribed by the Regulations for computing net income from instalment sales. In view of the benefits derived by so many concerns from the Treasury's liberal attitude in the past it may be expected that the Tax Board's position will be modified or the Treasury will have to insist that its past procedure be legalized by means of an amendment to the law.

SALE OF REAL ESTATE IN LOTS.—When a tract of land is acquired for subdivision, the **cost** must be equitably **apportioned to the various lots,** a record being made on the books of the taxpayer. This allocated cost will be used as a basis for computing gain or loss on every lot sold. It is not permissible to treat the tract as a whole, crediting all sales against cost until the latter is extinguished. There is a measure of gain or loss in every lot sold, unless the selling price is identical with the allocated cost.

DEFERRED-PAYMENT SALES.—When the initial payment exceeds 25% of the selling price, the contracts are treated as deferred-payment sales. Under this method gain or loss is recognized at the time of sale to the extent of the difference between the amount of the initial payment plus the fair market value of the notes or other obligations received and the cost or other basis. If, then, the obligations of the purchaser are readily marketable, the profit will be taxable in the year of sale. However, if the purchaser's obligations could not be sold at a reasonable discount, the collections thereon and the initial payment are credited against the cost or other basis of the property no profit being realized until the total receipts exceed the cost or other basis. In some cases decided by the Treasury where the notes could be discounted

only at a sacrifice, the sales were considered to be on the instalment plan. It is possible, therefore, in some instances that automobile sales may be so considered.

CAPITAL GAINS.—The capital gain and loss provisions (q. v.) apply to instalment and deferred-payment sales.

Income from Interest

All interest not specifically exempt (see Exempt Income) is to be included in gross income. Interest accruing prior to March 1, 1913, is not taxable. Taxpayers on the accrual basis must accrue all collectible interest, while those on the cash basis, return only interest collected or available for collection.

DISCOUNT ON BONDS.—Since bond discount is an interest adjustment, the purchaser of bonds issued at a discount realizes income to the extent of the discount when such bonds are redeemed at par. However, such income is usually returned under the category of income from sales of securities. (For the treatment of municipal bonds issued at a discount, see Exempt Income.) The Treasury holds that the obligor on bonds issued at a discount realizes taxable income if such bonds are repurchased and retired by the obligor at less than the issue price plus accrued discount. This matter is now before the courts for decision.

SECURITIES ACQUIRED BETWEEN INTEREST DATES.—When the buyer pays to the seller the accrued interest from the last interest date to the date of sale, each should return as income the portion of the interest coupon assignable to the period during which each respectively held the securities.

ANNUITIES.—Annuities are in general taxable to the extent that the aggregate receipts exceed the payment made by the annuitant for the contract. If the annuity arises from a gift prior to December 31, 1920, the basis will be the value of the contract at the date of gift and not its cost.

BUILDING AND LOAN ASSOCIATION.—Interest or dividends, above the exemption of $300 per annum up to and including 1926, is taxable if available to the shareholder. If the interest is not available until the maturity of the contract, it must be returned as a whole at that time. As a rule, part of the interest is immediately available when credited, the remainder becoming available only if the shares are held to maturity. The available interest should be returned in the year it is credited.

TAX-FREE COVENANT BONDS.—No tax paid by the obligor under bonds containing a tax-free covenant clause need be returned as income by the obligee. However, interest received from such bonds must be shown separately on returns.

FEDERAL GOVERNMENT, STATE AND MUNICIPAL SECURITIES.—The interest on **all Liberty bonds** is **free from normal tax.** The **exemption from surtax** applicable to such interest is as follows:

1st 3½% Liberty bonds, totally exempt.
4% and 4¼% Liberty bonds, exemption of interest up to July 2, 1926, on an aggregate principal of $50,000.

In addition to the above, the interest on an aggregate principal of $5,000 of 4% and 4¼% Liberty bonds, Treasury 4¼% bonds, Treasury certificates (of indebtedness) and Treasury (war) savings certificates, is exempt from normal and surtax without limitation of time. Liberty bond interest is to be returned

as accruing or as received, depending on the basis of reporting income used by the taxpayer.

The exemptions are computed upon the actual principal. If at any time the maximum exemption is exceeded, the interest on the excess is subject to surtax for the period the maximum exempt principal is so exceeded.

All interest on **Treasury notes** is subject to surtax; there is no exemption. **Treasury 4 1/4% bonds, certificates of indebtedness, and war savings certificates** are included with 4% and 4¼% Liberty bonds in the aggregate $5,000 principal exemption stated above.

As heretofore stated, interest on **state and municipal** securities is non-taxable. (See Exempt Income.)

CORPORATIONS.—As a corporation pays only a normal tax, interest on all United States obligations received by it is exempt.

PARTNERSHIPS AND FIDUCIARIES.—Interest from all United States obligations and from state and municipal securities is excluded from Forms 1065 and 1041. Such amounts will be considered by the individuals in preparing their own returns, each taxpayer being entitled to his full separate exemption.

NON-RESIDENT ALIENS.—Interest on all United States obligations is exempt from tax while beneficially owned by non-resident aliens, foreign corporations, partnerships or associations not engaged in business in the United States.

Income from Sales and Exchanges

The principles underlying the determination of both gains and losses from sales or exchanges of property are so nearly identical that both the taxable gains and deductible losses arising from such transactions will, for convenience, be discussed together. However, it must be noted that this subject is one of the most intricate and involved in the whole realm of income taxation so that only a general outline can be presented here. For more comprehensive treatment reference must be made to the relevant chapters in Montgomery's "Income Tax Procedure."

SPECIAL DEFINITIONS.—Certain statutory definitions relating to certain phases of sales and exchanges must be kept in mind in considering this subject:

The term **"reorganization"** is given a special definition by statute as meaning (1) a merger or consolidation (including the acquisition by one corporation of at least a majority of the voting stock and at least a majority of the total number of shares of all other classes of stock of another corporation, or substantially all the properties of another corporation); or (2) a transfer by a corporation of all or a part of its assets to another corporation if immediately after the transfer the transferor or its stockholders or both are in control of the corporation to which the assets are transferred; or (3) a recapitalization; or (4) a mere change in identity, form, or place of organization, however effected.

The term **"a party to a reorganization"** includes a corporation resulting from a reorganization and includes both corporations in the case of an acquisition by one corporation of at least a majority of the voting stock and at least a majority of the total number of shares of all other classes of stock of another corporation.

The term **"control"** means the ownership of at least 80% of the voting stock and at least 80% of the total number of shares of all other classes of stock of the corporation.

A distribution in pursuance of a plan of reorganization, by or on behalf of a corporation a party to the reorganization, of its stock or securities, or stock or securities in a corporation a party to the reorganization, is not considered a distribution of earnings or profits within the meaning of subdivision (b) of Section 201 for the purpose of determining the taxability of subsequent distributions by the corporation.

GENERAL RULE FOR RECOGNITION OF AMOUNT OF GAIN OR LOSS.—Except as otherwise provided by law and stated hereinafter, the gain from the sale or other disposition of property shall be the excess of the amount realized therefrom over the "basis" as hereinafter described, and the loss shall be the excess of such basis over the amount realized. In other words, gain or loss is recognized in all sales or other dispositions of property unless special provision is made by statute for no gain or loss to be recognized in certain cases. The amount realized from the sale or other disposition of property shall be the sum of any money plus the fair market value of the property (other than money) received.

In computing the gain or loss **proper adjustment** is to be made for (1) capital improvements and betterments made since the date of acquisition or other basic date and for carrying charges, such as taxes on unproductive property, and (2) for any item of loss, depreciation, depletion, amortization or similar deductions previously allowed with respect to the property. Thus, if property was purchased in 1922 at a cost of $10,000 and capital expenditures thereafter amounted to $5,000, but depreciation of $2,000 had been allowed thereon, the basis in the case of sale would be $10,000 plus $5,000 minus $2,000, or $13,000. A sale for $15,000 would indicate a gain of $2,000, while a sale for $10,000 would give a loss of $3,000. The law states that the foregoing provisions are not to be construed to prevent the use of the instalment sales method, as outlined under "Income from Instalment Sales."

Having outlined the general basis for the recognition of the **amount** of gain or loss, it is now necessary to consider its application to special cases under the headings, (1) recognition of gain or loss, and (2) determination of the "basis."

Recognition of Gain or Loss from Sales and Exchanges

NO GAIN OR LOSS RECOGNIZED.—The law provides for the recognition of gain or loss as previously outlined in all cases except the following:

In certain classes of transactions no gain or loss is recognized. Such cases are:

1. Exchange of property held for productive use in trade or business or for investment (but excluding stock in trade or other property held primarily for sale, and stocks, bonds, notes, choses in action, certificates of trust or beneficial interest or other securities or evidences of indebtedness or interest), solely for property of a like kind to be held either for productive use in trade or business or for investment. An **exception** is made when common stock in a corporation is exchanged solely for common stock in the same corporation, or preferred stock for preferred stock under similar conditions, so that no gain or loss is recognized in such cases.

Gain or loss will be recognized if, say, Pennsylvania Railroad stock is exchanged for American Woolen Co. stock, or if real estate is exchanged for personal property.

2. Stock or securities in a corporation a party to a reorganization exchanged, in pursuance of the plan of reorganization, solely for stock or securities

in such corporation or in another corporation a party to the reorganization.

This provision permits stockholders in reorganization to receive other stock or securities such as bonds in exchange for their prior stock or securities without the recognition of gain or loss.

3. A corporation which is a party to a reorganization exchanges property in pursuance of the plan of reorganization, solely for stock or securities in another corporation a party to the reorganization.

Under this exception a corporation can in a reorganization sell its property to another corporation without the recognition of gain or loss.

4. Property transferred by one or more persons to a "controlled" corporation solely in exchange for stock or securities of such corporation, provided that where there is more than one transferor the amount of stock or securities received by each is substantially in proportion to his interest in the property prior to the transfer.

Thus, an individual can form a corporation to hold some of his property as long as he receives over 80% of the voting and other stock in the corporation, without the recognition of gain or loss.

5. Compulsory or involuntary conversions of property into (a) property similar or related in service or use, or (b) money, if such money is forthwith expended in the acquisition of similar or related property, or in the acquisition of control of a corporation owning such property, or in the establishment of a replacement fund to be subsequently applied to similar uses.

Such cases are in condemnation proceedings or seizures whether actual or imminent. If a replacement fund is to be established the Commissioner's rules therefor, as set forth in the regulations, must be followed. Gain (but not loss apparently) is recognized if any part of the money received is not expended, but not in excess of the amount unexpended.

NO LOSS RECOGNIZED.—No loss will be recognized in cases (1), (2), (3), or (4) as outlined above under "No Gain or Loss Recognized" even if money and/or other property is received in addition to the property therein specified. It will be noted later that gain will be recognized under such conditions, with one exception, but no loss will be recognized. This provision was inserted to prevent the deduction of losses by the expedient of adding a small amount of money or other property in the exchange.

NO GAIN RECOGNIZED.—In the following cases the statute provides that no gain is recognized:

1. A distribution, in pursuance of a plan or reorganization, to a stockholder in a corporation a party to the reorganization of stock or securities in such corporation or in another corporation a party to the reorganization, without the surrender by the stockholder of his stock or securities in such corporation.
2. A corporation, in pursuance of a plan of organization, exchanges property for stocks or securities in another corporation together with money and/or other property, distributing such money and other property, if any, to its stockholders.

No gain is recognized to the corporation in case (2), but gain may accrue to the stockholder.

GAIN RECOGNIZED.—

1. Gain is recognized in cases (1), (2) and (4) as outlined under "No Gain or Loss Recognized" if, in addition, money or other property is received.

However, the amount of the gain so recognized is limited to the extent of such money and other property, if any. The money or other property received in these transactions is usually referred to as "boot." The receipt of "boot" immediately results in the limited recognition of gain but does not permit the deduction of loss. If the distribution made in the cases outlined above has the effect of a taxable dividend, then the amount of gain recognized shall be taxed to the distributee as a dividend to the extent of his ratable proportion of the undistributed earnings and profits accumulated after February 28, 1913, the balance being taxed as a gain from the exchange of property.

2. In a case similar to case (2) under "No gain recognized" gain is imputed to the corporation if the "boot" is not immediately distributed to stockholders.

As in the foregoing cases, the gain so computed is limited to the amount of the "boot."

Illustrations of transactions of most of the classes outlined in the foregoing paragraphs will be found in the regulations and are discussed in Montgomery's "Income Tax Procedure."

Determination of Basis

As regards **property acquired after February 28, 1913,** the basis for determining gain or loss is cost except in the following cases:

INVENTORIED GOODS.—If the property should have been included in the last inventory, the **last inventory value** shall be used.

GIFTS AFTER DECEMBER 31, 1920.—In the case of property acquired by gift after December 31, 1920, the basis to be used by the donee is that **which would have been used by the donor or by the last preceding owner by whom it was not acquired by gift.** If the donee is unable to ascertain such basis, it shall be determined by the Commissioner.

TRANSFERS IN TRUST AFTER DECEMBER 31, 1920.—The basis to be used for property acquired by a transfer in trust after December 31, 1920 (other than by a transfer or trust by bequest or devise) is that **which would have been used by the grantor plus any gain or minus any loss recognized to the grantor at the time of transfer.** This provision does not apply to property acquired under transfers or trust in contemplation of or intended to take effect in enjoyment or possession at the grantor's death, nor when the trust is revocable by the grantor alone or in conjunction with any person or where the grantor relinquished his power to revoke in contemplation of death, nor to property received under the exercise of a general power of appointment by will or deed executed in contemplation of or intended to take effect in possession or enjoyment at or after death.

The foregoing is inconsistent with other sections of the law and will have to be judicially interpreted before it can safely be relied on.

GIFTS OR TRANSFERS IN TRUST ON OR BEFORE DECEMBER 31, 1920.—In the case of property acquired on or before December 31, 1920, by gift or by transfer in trust, the basis is the **fair market value of the property at the time of such acquisition.**

BEQUESTS, DEVISES, ETC.—The basis to be used for property acquired by bequest, devise or inheritance shall be the **fair market value of such property at the time of such acquisition.** This includes the transfers excepted under Transfers in Trust after December 31, 1920 (outlined above).

NON-TAXABLE EXCHANGES.—Where property is acquired in exchanges upon which no gain or loss is recognized (outlined hereinbefore), the basis to be used is **that applicable to the original property.** If the exchange would have been non-taxable except for "boot" being received, the basis will be that of the old property decreased by the amount of any money received plus any gain recognized in the exchange. In those cases where the "boot" or part thereof is property other than cash, an allocation is to be made between the "boot" and other property so that the fair market value of the "boot" is allocated thereto.

CERTAIN REORGANIZATIONS AFTER DECEMBER 31, 1917.—The basis to be used for property (other than stock or securities in a corporation a party to the reorganization) acquired after December 31, 1917, by a corporation in a reorganization when an interest or control of 80% or more remains in the transfers of such property, will be the **same as it would be in the hands of the transferor, plus any gain or minus any loss recognized to the transferor at the time of transfer.**

CERTAIN REORGANIZATIONS AFTER DECEMBER 31, 1920.—When property (other than stock or securities in a corporation a party to a reorganization) has been acquired after December 31, 1920, by a "controlled" corporation, the basis to be used is that which **would have been used by the transferor plus any gain or minus any loss recognized to the transferor at the time of transfer.**

SECURITIES DISTRIBUTED AFTER DECEMBER 31, 1923.—When stock or securities are distributed in a reorganization to stockholders without the surrender of their old stock, the basis in respect of the stock on which the distribution was based is **to be apportioned between the old and new securities on the basis of values at the time of distribution,** except that that part of the basis allocated to the new stock may not exceed its fair market value when distributed.

INVOLUNTARY CONVERSIONS.—The basis to be used in such cases is the basis applicable to the property converted less any money not expended in similar property plus any gain or minus any loss recognized at the time of conversion.

WASH SALES.—In the case of "wash sales" after December 31, 1920, the basis to be used for the new stock will be that of the old stock plus the excess of the repurchase price of the new over the sale price of the old or minus the excess of the sale price of the old over the repurchase price of the new.

STOCK DIVIDENDS.—When stock dividends are received there is no tax thereon, but for use when and if the new or old stock is sold, the basis applicable to the stock upon which declared must be allocated between the new and old stock as follows:

1. When the dividend stock is of substantially the same character or preference as the old, the basis of each share of old and new will be the quotient of the basis of the old divided by the total number of old and new shares.
2. When the dividend stock is of a materially different character or preference, the basis of the old stock will be divided between the old and new stock in proportion to the respective values of old and new

stock at the time the latter is issued. The proportion of the basis applicable to the new stock cannot exceed the fair market value of the new stock at the time of issuance.

3. If the identity of shares purchased and sold cannot be established, sales of the original stock are applied to the earliest purchases of the original stock and sales of dividend stock to that issued in respect of the earliest purchases of the original stock.

PROPERTY ACQUIRED BEFORE MARCH 1, 1913.—The basis to be used in the case of property acquired before March 1, 1913:

1. Cost or basis outlined above under inventoried goods, gifts or transfers on or before December 31, 1920 or bequests, devises, etc., as the case may be, or
2. Fair market value of the property as at March 1, 1913 **whichever is higher.**

What the fair market value was at March 1, 1913, is a fact to be determined by competent evidence. Due regard must be given to the fair market value of corporate assets in determining the value of the stock of the corporation. For a discussion of the valuation of specific types of property see Montgomery's "Income Tax Procedure."

Sales of Capital Assets

While the rules relative to the determination and recognition of gain or loss apply to all sales and exchanges, **special tax computations** have to be made in connection with the gain or loss arising from the sale or exchange of a special class of property, which comes within the statutory definition of capital assets. The tax computations are outlined hereinafter under Rates and Computation of Tax. It is considered advisable to discuss at this point the statutory definitions applicable to capital assets.

CAPITAL ASSETS DEFINED.—The term "capital assets" means property held by the taxpayer for more than 2 years (whether or not connected with his trade or business), but **does not include stock-in-trade** of the taxpayer or other property of a kind which would properly be included in the inventory of the taxpayer if on hand at the close of the taxable year, or **property held by the taxpayer primarily for sale** in the course of his trade or business.

APPLICATION OF THE 2-YEAR PROVISION.—The specific property must in general have been held for more than 2 years. However, **stock dividend shares** are considered to have been held as long as the stock upon which declared. Similarly in exchanges where no gain or loss is recognized, the new property takes the status of the old. When property is acquired by inheritance, the 2-year period runs from the decedent's death. When property is acquired by gift, the 2-year period commences at the date of gift.

CAPITAL GAINS AND LOSSES.—The term "capital gain" means **taxable gain** from the sale or exchange of capital assets consummated after December 31, 1921. The Treasury holds that the redemption of bonds at maturity is not a "sale or exchange." Holders should sell bonds before maturity, if possible and if desirous of obtaining the benefit of the capital gains provision. The term "capital loss" means **deductible loss** resulting from the sale or exchange of capital assets.

CAPITAL AND ORDINARY DEDUCTIONS.—**Capital deductions** are those allowed by law for the purpose of computing net income but which are allocated to or chargeable against capital assets sold or exchanged during the

taxable year. This includes items of expense connected with the sale or exchange of a capital asset, such as brokers' commissions. **Ordinary deductions** are those allowed for the purpose of computing net income, other than capital losses and capital deductions.

Ordinary net income means the net income as ordinarily computed under the law but after excluding all items of capital gain, capital loss and capital deductions.

CAPITAL NET GAIN AND LOSS.—This is defined to be the excess of the total amount of capital gains over the sum of (1) capital deductions and capital losses plus (2) the excess, if any, of ordinary deductions over gross income computed without the inclusion of capital gain. **Capital net loss** means the excess of the sum of the capital losses plus capital deductions over the total amount of capital gains. For the computations necessary in the case of capital net gains and capital net losses, see Rates and Computation of Tax hereinafter. For the application of statutory net losses when capital net gains or capital net losses occur in subsequent years, see Deductions for Net Losses.

Income from Dividends

Dividends under the law comprise any distributions, whether **in money or in other property,** in the ordinary course of business, even though extraordinary in amount, made by any corporation out of its earnings or profits accumulated since February 28, 1913. In addition to dividends so defined, consideration must also be given to **distributions in liquidation** (so-called liquidating dividends), distributions from sources other than earnings or profits accumulated since February 28, 1913, and stock dividends. Dividends as defined by statute constitute gross income of the recipients and are taxable at the rates of tax in force for the year when received or when subject to the demand of stockholders. With the exception of earnings prior to March 1, 1913, no cognizance is taken of the period during which the earnings have been accumulated by the paying corporation. The owner of record is liable for the tax due, unless he discloses the name and address of the true owner.

CREDITS AND DEDUCTIONS FOR DIVIDENDS.—Individuals are allowed a credit for the purpose of normal tax only of certain dividends. Corporations deduct from gross income certain classes of dividends. These credits and deductions are treated hereinafter under Credits and Deductions for Dividends, respectively.

NON-TAXABLE DISTRIBUTIONS.—These may be classified as follows:

1. Distributions from earnings or profits accumulated or increase in value accrued prior to March 1, 1913.
2. Distributions in partial or complete liquidation—to the extent of capital returned.
3. Distributions not under 1 or 2, to the extent of capital returned.
4. Distributions of earnings of personal service corporations accumulated 1918-1921.
5. Distributions of stock and/or securities in another corporation which is a party to a reorganization.

Stock dividends do not constitute "distributions."

Distributions of classes 1 and 3 to be non-taxable can be made only after all earnings or profits accumulated since February 28, 1913, have been distributed. In other words, all taxable distributions must be completed before

non-taxable ones will be recognized. Under the law every **distribution** is made **from the most recently accumulated earnings or profits.** The earnings to be used will be those shown by the books (not tax returns), adjustments being made for any departures from good accounting practice.

Distributions of class 1 include those made from surplus at March 1, 1913, or from appreciation accrued prior to that date but realized thereafter. Those in class 3 include distributions of unrealized appreciation accrued subsequent to March 1, 1913, also from depreciation and depletion reserves. To the extent that distributions in class 3 do not exceed the basis applicable to the stock on which they are declared, they are tax-free.

Personal service corporations were treated for tax purposes in the same manner as partnerships in the years 1918 to 1921 inclusive. Since the earnings of those years were taxed to the stockholders at that time, distributions therefrom (class 4) are non-taxable. Earnings accumulated subsequent to December 31, 1921, must be distributed first.

If in a reorganization a corporation receives stock and/or securities in another corporation, a party to the reorganization, and immediately thereafter distributes the stock to its stockholders, such a distribution (class 5) is not taxable.

Distributions in complete or partial liquidation are treated as payments for the sale of part or all of the stock. If in excess of the cost or other basis, such excess is taxable; if less than the basis, then the deficiency is deductible as a loss. Partial liquidations include the complete cancellation or redemption of a part of a corporation's stock or one of a series of distributions in complete cancellation or redemption of all or a portion of its stock. The provisions relating to capital gains and capital losses (q.v.) are applicable to distributions in liquidation.

STOCK DIVIDENDS.—A stock dividend is one declared by a corporation, payable in stock of the same corporation. As a result, **surplus is capitalized.** The stock distributed need not be of the same class as that upon which the stock dividend is declared. Stock dividends are not "distributions." They are **not subject to tax** unless the declaration thereof is merely a subterfuge for the declaration of a cash dividend, as a result of previous or subsequent cancellation or redemption of the stock issued as a dividend. The courts have held that where a corporation declares a cash dividend which is to be used solely to purchase additional stock, such dividend is to be treated as a stock dividend. This procedure will have to be followed in any state not permitting stock dividends. Due to the non-taxability of stock dividends, certain computations are necessary to determine gain or loss upon disposition of any of the dividend stock or of the stock upon which stock dividends have been declared. The necessary computations have been outlined hereinbefore under Income from Sales.

MISCELLANEOUS.—Taxes paid by banks on capital stock on behalf of stockholders no longer constitute additional dividends to such stockholders.

When the **salaries paid to executives** of corporations are deemed excessive by the Treasury, they are treated as dividends to the extent of such excess, if the salaries paid bear a close relationship to the stock holdings.

If any tax is deducted at source from foreign dividends such tax must be added back to the amount actually received in returning the income from such foreign dividends. A credit for part or all of such tax may be obtained in certain cases (see Credit for Foreign Taxes, page 1614).

DIVIDENDS PAID OTHERWISE THAN IN CASH.—Most dividends are paid in cash. If, however, a dividend is paid in **stock of another corporation** (not as part of a reorganization scheme nor in partial liquidation), or in **bonds of the same or another corporation** or in Liberty bonds, or in other property, such dividend is to be returned at the fair market value of the property when received. **Scrip dividends** are generally taxable when received. In some cases an option is given under which stockholders may receive stock at maturity; if such option is exercised, the scrip dividends should be treated as stock dividends. If property of a corporation is sold to stockholders for less than its fair value, the Treasury holds that the difference constitutes a dividend to such stockholders.

Income from Partnerships and Fiduciaries

DATA REQUIRED FOR TAX RETURN.—In the returns for individuals, provision is made for returning income from partnerships and from fiduciaries. Due to the fact that the income from such sources may have to be divided into several classes, the total income will not be placed on the line apparently provided therefor. Before an individual who receives income from a partnership, or from an estate or trust, prepares his tax return, he must secure from the partnership or fiduciary, the amounts of the following items respectively:

1. Dividends of domestic corporations free from normal tax.
2. Principal of and taxable interest on United States obligations.
3. Principal of and interest on tax-exempt securities.
4. Capital net gain or loss.
5. Earned income from partnership.
6. Donations not deducted by partnership.
7. Foreign income and excess profits taxes.
8. Interest on bonds having tax-free covenant.

The individual will return these items together with any similar items received or paid personally. The balance of the income from the partnership, estate or trust will be returned under the caption appropriated thereto.

PERIOD IN WHICH INCOME RETURNED.—The determination of the income to be returned as from a partnership or fiduciary is usually not difficult. However, the regulations regarding the period in which such income is taxable cause considerable complication in some cases. If the **taxable years** of the individual taxpayer and of the partnership or fiduciary are the same, no difficulty arises, since the individual takes up the income from the partnership or fiduciary in his return for the same year, independent of whether he is on the cash or accrual basis.

However, if the fiscal years of the individual and the partnership or fiduciary are not the same, the individual will include in his return the income from the partnership or fiduciary for its fiscal year ended within the individual taxpayer's fiscal year. Thus, if the individual's fiscal year ends on August 31 and that of the partnership or fiduciary ends on November 30, the individual will include the income from the partnership or fiduciary for its year ended November 30, 1925 in his return for the year ended August 31, 1926. If the tax rates for the two calendar years entering into the fiscal year change or if the computation of income or allowance of deductions changes, the computation of the individual's tax liability becomes very involved. The subject is briefly treated hereinafter (see Rates and Computation of Tax, page 1612).

In order to minimize the difficulties, it is recommended that the taxable years of partnerships and the members thereof be made to coincide. The

fiscal years of fiduciaries are more difficult of adaptation, unless the same basis is chosen by all parties.

Income from Rents and Royalties

PAYMENTS BY LESSEES OF TAXES, ETC.—Rent received or accrued, whether received in cash or other property, is taxable. The **chief problem** is found in connection with the income arising from improvements or payments made by lessees on behalf of lessors. Taxes paid by a lessee to or for a lessor constitute income to the lessor. Similarly, if the tenant is required to pay for repairs, such amounts are income to the lessor. The lessor may deduct such payments made on his behalf if such amounts would have been deductible had he paid them direct. When property of a corporation is leased under a contract whereby the lessee pays a rental equal to the interest or dividend, respectively, on securities such payment constitutes income to the lessor, even if the payments are made direct to the obligees or shareholders, respectively.

PERMANENT IMPROVEMENTS BY LESSEES.—Since the **title to permanent improvements** made by a lessee usually vests in the lessor as soon as made, income to the lessor may arise therefrom. The Treasury permits this income to be reported in one of two ways:

1. The lessor may report as income at the time of completion of the improvements, the fair market value thereof subject to the lease. Ordinarily this amount will be the difference between the value of the land free from the lease and without the improvements and the value of the land subject to the lease but with the improvements.
2. The lessor may spread over the life of the lease the estimated depreciated value of the improvements at the termination of the lease, reporting as income for each year an aliquot part thereof.

Provision is made for adjustments if the lease is prematurely terminated.

ROYALTIES.—Royalties received or accrued constitute taxable income. Since they are usually provided for by contract, the question of when they become payable is decided by the interpretation of the contract. In case of dispute as to title, the royalties **follow the property** and constitute income to the true owner. Royalties from mines, oil wells and other natural resources are **subject to depletion charges.** This is true even in the case of advanced royalties. The subject of depletion is discussed hereinafter under Deductions for Depletion.

Deductions from Gross Income

WHEN DEDUCTIONS SHOULD BE MADE.—Just as each year's return should contain all the income items for that period, so all authorized deductions applicable to the taxable year must be deducted in the return for that year. Expenses or liabilities of one year cannot be used to reduce the income of a subsequent year, except in so far as a statutory net loss may be carried forward and so applied. If a taxpayer neglects to deduct in his return the expenses, losses, taxes, interest, etc., applicable thereto, he may lose the benefit thereof entirely, unless he corrects his error within the statutory period for filing refund claims. (See Claims for Refund.)

Authorized allowances may be deducted under the cash or accrual method.

Under the "cash" method, the deductions will be taken when the relevant items are paid; under the accrual system, when the liability is incurred or under good accounting practice should be set up. Provision is, however, made for the allowance of deductions in periods other than those in which sustained, when such procedure would more correctly reflect the true income.

DEDUCTIONS NOT PERMITTED.—Deductions may not be made for—

1. Personal living or family expenses.
2. Amounts paid for permanent improvements or betterments made to increase the value of property.
3. Amounts expended to restore property or to make good depreciation, etc., for which an allowance is or has been made.
4. Premiums paid on insurance covering the life of an officer or employee, or anyone financially interested in the taxpayer's business when the taxpayer is directly or indirectly a beneficiary.
5. Shrinkage in value of a life estate nor deductions from income of life estates not allowed by states, territories or District of Columbia.

PERSONAL AND FAMILY EXPENSES.—The personal or ordinary living expenses of taxpayers may not be deducted. As examples of so-called personal expenses, there may be cited life insurance premiums, fire, etc., insurance on a taxpayer's house, allowances made by a father for the services of unemancipated minor children, commutation fares, expenses of upkeep of automobiles used for pleasure, wages of domestic help, and tuition fees. The Treasury holds that the cost of uniforms of nurses, railway trainmen, barbers, surgeons and baseball players are personal expenses and so not deductible.

CAPITAL EXPENDITURES.—The cost of permanent improvements or betterments which increase the value of property cannot be deducted. Although some expenditures do not "increase the value of property," yet the Treasury does not permit their deduction. Alterations to adapt a building to a taxpayer's use, and changes in water and sewer pipes, are examples in this class. Among non-deductible expenditures the Treasury has placed the cost of defending or perfecting title to property, architects' fees, stock selling commissions, expenses of administration of an estate, voluntary assessments of stockholders, organization fees of a corporation (taxes paid in connection therewith may be deducted), dividends of a subsidiary guaranteed by a holding company, stock exchange listing fees, cost of installing machinery, and resurveying property.

PREMIUMS ON BUSINESS INSURANCE.—Where a taxpayer is directly or indirectly a beneficiary under an insurance policy taken out on the life of an officer, employee or one financially interested in his or its business, the premiums on such insurance may not be deducted. The increased efficiency of employees as a result of insurance alone is not considered to bar the deduction of premiums. If life insurance is taken out on the life of the lender in order to procure a loan, the proceeds to be applied in satisfaction of the loan, the premiums may not be deducted.

EXPENDITURES TO MAKE GOOD DEPRECIATION, ETC.—As taxpayers are allowed deductions for depreciation, obsolescence, etc., amounts expended to make good such depreciation, etc., must be charged against reserves set up to cover such allowances and may not be deducted from gross income.

Deductions for Interest

Corporations and individuals may deduct all interest paid or accrued during the taxable year, except interest on indebtedness incurred to purchase or carry securi

ties the interest from which is wholly exempt from tax. Thus interest paid to purchase or carry state or municipal securities may not be deducted. As to United States obligations, the only securities which are wholly tax-exempt are the pre-war issues and the 3½% Liberty bonds. Thus the interest on loans to purchase or carry any Liberty bonds (other than the 3½'s) or Treasury certificates or notes may be deducted. These rules apply also to loans where wholly exempt securities are used as collateral, so that such securities should not be used unless it is unavoidable.

Examples of deductible interest sometimes overlooked are interest on mortgages (even if on the taxpayer's personal residence), on scrip dividends, on certificates of deposit, on overdue federal taxes and on local assessments the payment of which is deferred. When bonds are issued at a discount, cash discount is to be amortized over the life of the bonds and deducted as additional interest paid. As instances of non-deductible interest may be noted: Interest on taxpayer's own capital for cost keeping purposes, interest on partners' capital, and so-called interest on preferred stock (really dividends).

Deductions for Taxes

Taxpayers may deduct taxes paid or accrued during the taxable year with the exception of those falling in the following five classes:

1. Income, war-profits and excess-profits taxes imposed by the authority of the United States.
2. That part of foreign income, war-profits and excess-profits taxes as is allowed as a credit (see Credits).
3. Local benefit taxes which tend to increase the value of property against which assessed.
4. Taxes imposed upon an individual taxpayer's interest as shareholder of a corporation, paid by the corporation without reimbursement from the taxpayer. Such taxes are deductible by the paying corporation.
5. 2% tax paid by obligor under tax-free covenant in a bond.

With the exceptions above noted, all taxes are deductible by the taxpayer against whom they are assessed. A husband cannot deduct in his individual return taxes paid by his wife. The deduction may be made in a joint return. Similarly manufacturers' taxes (e.g., on automobiles) cannot be deducted by the purchaser at retail.

FEDERAL ESTATE AND STATE INHERITANCE TAXES.—Federal estate taxes paid or accrued during the taxable year may be deducted from the gross income of the estate. Federal estate taxes accrue one year after the decedent's death. If the estate is **on a cash basis** the tax is deductible when paid; if **on the accrual basis,** when accrued or when paid (if before the accrual date).

States impose inheritance taxes of two classes: (1) those imposed on the right to transmit property, as in Pennsylvania and Utah, and (2) those imposed on the right to receive property, as imposed by other states and territories. Rhode Island imposes taxes of both classes. Inheritance taxes in class 1 may be deducted by the **estate,** those in class 2 by the individual **beneficiaries** from their gross income. This arrangement applies even if the will provides for some other method of payment of the taxes imposed. However, if the laws of the particular jurisdiction impose the taxes on specific beneficiaries, then such beneficiaries alone can take the deduction.

LOCAL BENEFIT TAXES.—**Assessments,** often called taxes, paid for local benefits, such as streets, sewers, sidewalks, etc., imposed because of benefit to certain specific property against which assessed, cannot be deducted. Taxes for general benefits assessed on all property in a certain location are deductible. Assessments for maintenance or repair of local benefits are deductible if a necessary business expense. The fundamental principle is whether the special assessment tends to increase the value of the property against which assessed. Where value is increased, the assessments must be capitalized and not deducted.

OTHER DEDUCTIBLE TAXES.—Included among deductible taxes are import or tariff duties, stamp taxes, automobile and other license fees, gift taxes, federal capital stock tax, state franchise taxes, state income taxes, foreign taxes (except that part allowed as a "credit") and all property taxes (except those for local benefits which increase the value of the property).

Customs duties may be deducted even though paid upon jewelry, clothing and other personal items.

NON-DEDUCTIBLE TAXES.—Among taxes which may not be deducted are federal income tax, delinquent taxes paid by mortgagee, 2% federal income tax paid by obligors under tax-free covenants (but state taxes assumed may be deducted), taxes on bank stock (non-deductible by shareholders, but deductible by bank), and that part of foreign income and profits taxes allowed as a "credit."

Deductions for Losses

GENERAL.—**Individuals** may deduct losses sustained during the taxable year and not compensated for by insurance, etc., which fall within the following classes:

1. Losses incurred in the taxpayer's business.
2. Losses incurred in transactions entered into for profit.
3. Losses arising from fires, storms, shipwrecks or other casualties, or from theft.

Corporations may deduct all losses incurred, if not compensated therefor by insurance or otherwise. An exception is made for both individuals and corporations whereby losses arising from "wash sales" as described hereinafter are not allowed as deductions. Losses, to be deductible, must usually be evidenced by **closed or completed transactions.** Where books are kept, losses are usually charged off thereon and this action may be evidence that the taxpayer considered the transaction as completed at that time.

The basis to be used in computing losses is the same as would have been used in the case of a profit, generally the cost of the property, or March 1, 1913, value thereof, whichever is higher. The determination of the basis has been considered under Income from Sales. Adjustment has to be made in the basis, for capital expenditures on the property and for depreciation, depletion, amortization and obsolescence to the extent allowed in previous tax returns. Losses on the sale of **capital assets,** as defined in the statute, must be segregated from other losses, since such losses may require a special computation of tax liability. (See Rates and Computation of Tax, page 1614.) The year in which the loss occurs usually determines the period in which the deduction is to be made, independent of the time when the amount of the loss is actually determined.

WASH SALES.—When a taxpayer (other than a dealer in securities) sells securities at a loss, but **within 30 days** before or after the sale, has acquired, or has entered into a contract or option to acquire substantially identical property,

such loss cannot be deducted. The "substantially identical property" is considered to take the place of the property sold and will be so treated in computing gain or loss on subsequent sale. The acquisition within the 30-day period of similar property by gift or bequest does not act to bar the deduction of the loss. If the acquisition within the 30-day period is to the extent of only part of the property sold, the corresponding part of the loss will be disallowed. The "wash sale" provision applies only to losses; gains under similar conditions have to be reported.

LOSSES FROM FIRES, CASUALTIES, ETC.—The deductibility of losses from fires, storms, shipwreck or from theft is not usually difficult of determination. In the case of losses from **theft,** it is necessary to be able to prove that the property in question was actually stolen and not merely "lost" or mislaid. The Treasury restricts somewhat narrowly the deduction of losses from "other casualty." Thus, losses have been denied which resulted from a bomb explosion, accidents due to the icy condition of pavements, collision of a pleasure car. Damage resulting to a taxpayer's residence as a result of the bursting of frozen water pipes was held deductible.

LOSS OF USEFUL VALUE.—Changes in business conditions, the abandonment of manufacture of a certain product, inventions permitting greater production or which reduce the cost of manufacture, often cause the premature discarding of buildings, machinery, etc. In such cases a loss may be deductible if the abandonment is permanent. The unforeseen cause must be established to the satisfaction of the Treasury. If the abandonment can be definitely foreseen, an allowance for obsolescence should be claimed as part of the depreciation allowance.

NON-DEDUCTIBLE LOSSES.—The Treasury has disallowed the deduction of losses of the following classes: Sale of capital stock at a discount; shrinkage in value of securities; Imperial Russian 5½% bonds of 1916 and 6½% bonds of 1919; assessments paid by stockholders in reorganization, etc.; sale of individual's residence (unless purchased to be resold at a profit); sale of Treasury stock by corporation; premium paid on redemption of capital stock.

The **demolition of buildings,** etc., may result in a loss, but if a taxpayer buys real estate upon which buildings are located which are then demolished with a view to erecting a new building, no deductible loss arises from such demolition. When **bonds** are issued at a discount, such discount cannot be deducted immediately as a loss, but must be prorated over the life of the bonds, a proportionate part only of the total being deducted each year.

Deductions for Net Losses

METHOD OF DEDUCTION.—No place on any form is specified for deducting statutory net losses. For convenience, such net losses may be deducted on the line provided for losses, a schedule explaining the computation of the net loss being attached to the return. Any taxpayer having a statutory net loss (explained below) may carry such net loss forward to the succeeding year (the "second" year) and deduct it from his ordinary net income and capital net gain for the "second" year, applying the balance against net income and capital net gain for the next succeeding year (the "third" year). It will be noted that capital net losses are excluded from consideration in the "second" and "third" years.

NET LOSS DEFINED.—The term "net loss" means the excess of allowable deductions over gross income plus—

1. The excess of deductions not attributed to trade or business over gross income not arising from trade or business.
2. The excess of capital losses over capital gains.
3. The excess of depletion based on discovery value over that based on cost.
4. Deductible dividends (corporations only).
5. The excess of tax-free interest over interest paid or accrued in purchasing or carrying wholly tax-exempt securities.

COMPUTATION OF NET LOSS.—The definition above can be better understood by considering the following official example from the regulations:

A, an individual conducting a trade or business, finds the following facts relating to 1924:

(a) His deductions as computed under section 214 amount to $100,000.

(b) Included in the deductions is an item of $10,000 for loss by fire of property occupied by him as a residence and not used in connection with his trade or business.

(c) Other deductions otherwise allowed under section 214 on account of transactions entered into for profit outside of his trade or business are $3,000.

(d) His taxable gains from transactions entered into for profit and not connected with his trade or business are $5,000.

(e) Donations to the Red Cross of $1,000 are included among the deductions.

(f) Depletion is claimed in the amount of $2,000, of which $500 is based upon the value of the mineral in the mine as of March 1, 1913, and $1,500 is attributable to increase in valuation on account of discovery subsequent to February 28, 1913.

(g) His entire gross income as computed under section 213 is $50,000.

(h) Interest received from municipal bonds exempted from taxation by section 213 (b-4) amounted to $10,000.

(i) Interest was paid upon money borrowed to carry municipal bonds in the amount of $8,000, which amount is not deductible under section 214 (a-2):

Total deductions (a)			$100,000
Deduct:			
Loss by fire (b)	$10,000		
Other deductions (c)	3,000		
Total deductions outside business	13,000		
Less: Gain outside business (d)	5,000		
Excess of deductions not sustained in trade or business over taxable gains or profits not derived from such trade or business	8,000		
Donations (e)	1,000		
Depletion on basis of value after discovery (f)	$2,000		
Less: Portion based on value as of March 1, 1913	500		
Portion of depletion representing discovery value in excess of cost or value as of March 1, 1913	1,500		
Total exclusion from deductions			10,500
Total expenses directly attributable to the conduct of the trade or business			89,500
Gross income (g)		50,000	
Add: Non-taxable interest received (h)	$10,000		
Less: Interest paid on money borrowed to carry municipal bonds (i)	8,000	2,000	52,000
Statutory net loss			$ 37,500

If A has an ordinary net income in 1925 of $25,000, and sustains a capital net loss of $10,000, he will pay no tax for 1925, since he had a net loss in 1924 of $37,500, and will carry over $12,500 as deduction for computing net income in 1926. If A in 1926 has ordinary net income of $10,000 and a capital net gain of $50,000, he may, at his option, pay a tax of 12½% upon $47,500.

APPLICATION OF NET LOSS.—A taxpayer sustaining a net loss as above computed may deduct such net loss from his ordinary net income of the succeeding year, any excess being similarly applied against the ordinary net income of the next succeeding year. If such taxpayer has a capital net gain for the "second" year, any excess of the net loss over the ordinary net income of that year may be applied in reduction of the capital net gain, the excess, if any, being similarly carried forward for application in the "third" year. If the taxpayer has a capital net loss for the "second" year or "third" year such capital net loss is ignored in applying the statutory net loss. In no case does the net loss of one year increase the net loss of a succeeding year.

The net loss provisions are applicable to the **members of partnerships and to estates and trusts** (not to the beneficiaries thereof).

Deductions for Bad Debts

TWO METHODS OF DEDUCTION.—A deduction for debts ascertained to be worthless in whole or in part is permitted. If the taxpayer is on the accrual basis, one of two methods may be used—(1) charge off bad debts when ascertained to be worthless in whole or in part, or (2) deduct a reasonable addition to a reserve for bad debts. If the latter method is being used, the actual debts ascertained to be worthless will be charged against the reserve for bad debts and will not be deducted from gross income. Taxpayers on the accrual basis were, in 1921, given an option as to the method used for their 1921 returns. The method selected for that year is binding for all years thereafter unless permission to change the method has been granted by the Commissioner. Taxpayers commencing business after 1921 may in their first accounting period establish the basis to be used by them thereafter.

RESERVES FOR BAD DEBTS.—Generally speaking, this method should be used by taxpayers on the accrual basis. The reserve method, however, cannot be used for one specific debt. Taxpayers adopting the reserve method may deduct from gross income each year a reasonable addition to such reserve. What constitutes a reasonable addition is a matter of judgment to be determined by each taxpayer in the light of all available data provided by his own business and by business conditions in general. The corporate return requires a statement of charge sales, etc., for the 5 years immediately preceding and for the amount of bad debts in each year of these years. Under similar business conditions, these data would enable the taxpayer to establish a percentage of gross charge sales to be set up as a reserve for bad debts. Changing conditions will require adaptation of this data to existing circumstances.

A reserve set up on sales is generally preferable to one based on outstanding accounts and notes receivable at the end of the year. However, there is no inhibition against the use of the latter method. Debts ascertained during the year to be worthless in whole or in part will be charged against the reserve. If such debts arose after the taxpayer commenced the use of the reserve method for tax purposes, such debts may not be deducted from gross income since the addition to the reserve is allowed as an annual equalizing deduction in respect of such debts. If the debts arose before the taxpayer began to use the reserve

method, such debts will be deductible since no addition to the reserve has been allowed in respect thereof.

CHANGE OF METHOD.—When a taxpayer desires to change from the deduction of actual debts method to the reserve method, application must be made to the Commissioner before the end of the taxable year. If permission is granted, the taxpayer must set up as of the beginning of the year of change a reserve which will adequately take care of accounts then outstanding. The amount of this reserve cannot be deducted from gross income. For the year of change and thereafter a reasonable addition to this reserve is an allowable deduction. In addition there may be deducted the amount of any debts which arose prior to the year of change which are ascertained to be worthless in whole or in part. The modification of this procedure required when a change from the reserve to the actual debt method is authorized should be obvious.

TESTS OF WORTHLESSNESS.—Consideration has to be given to the types of bad debts recognized by the Treasury and also to the time at which such debts are determined to be worthless. With the exception of claims arising or income accruing prior to March 1, 1913, no allowance for a bad debt can be made unless the income arising therefrom has previously been reported. Thus a taxpayer reporting on the cash basis cannot deduct an account ascertained to be worthless, since such account has not, on the cash basis, been previously returned as income. Loans, the forgiveness of which is tantamount to a gift cannot be deducted as bad debts. The actual relation of debtor and creditor must exist.

When the surrounding circumstances indicate that a debt is worthless and uncollectible, either in whole or in part and that legal action to enforce the debt is not likely to result in satisfactory execution on a judgment, or if such proceeding would cost more than is likely to be collected, then the debt is considered worthless, in whole or in part, as the case may be. Bankruptcy is generally an indication of worthlessness of debts in whole or in part. In the case of insolvency, it is necessary to ascertain what is likely to be received in final settlement; the balance may usually be charged off as a debt worthless in part. When mortgaged or pledged property is sold on foreclosure, etc., for less than the debt, the balance may be charged off by the mortgagee or pledgee if ascertained to be uncollectible.

Bonds and other securities actually ascertained to be worthless may be charged off. Mere market fluctuations do not warrant such action. Banks or other corporations under federal (or equivalent state) supervision may generally consider as worthless for tax purposes, debts which they are required to charge off by the supervisory authority. If books are kept, bad debts must be charged off when ascertained to be worthless. The actual charging off may or may not be evidence of worthlessness.

RECOVERIES.—Recoveries on account of debts previously charged off as worthless and deducted for tax purposes must be reported as income when received.

Deduction for Dividends

This deduction **applies only to corporations.** They may deduct from gross income the following classes of dividends:

1. From domestic corporations (except those organized under China Trade Act, 1922, and those whose income arises chiefly in a possession of the United States).
2. From those foreign corporations which derived over 50% of their gross income for the preceding 3 years from sources in the United States.

As applied to ordinary corporate taxpayers, the law allows the deduction of dividends received from practically all domestic corporations but only from a small minority of foreign corporations. The corporate deduction is upon the same basis as the individual credit (see Credits).

Deductions for Contributions

APPLICATION AND LIMITS.—The statutory deduction **applies only to individuals.** Corporations may deduct contributions, donations, etc., when it can be shown that such are necessary business expenses. In such cases, they should be deducted under "Other deductions" and not as "Contributions." Individuals may deduct contributions to the objects specified below to an aggregate amount not exceeding 15% of their net income computed without this deduction. A special exception was made in the 1924 law for those who were devoting almost their entire income to charities, whereby the whole amount of such contributions could be deducted under certain very special conditions. This exception does not interest the ordinary taxpayer and is consequently not discussed herein. Estates and trusts may deduct in full amounts paid or set aside in accordance with the wills or deeds of trust for the subjects enumerated below.

DEDUCTIBLE CONTRIBUTIONS.—Contributions falling in the following classes are deductible:

1. For the use of the United States, any state, territory or political subdivision thereof or the District of Columbia, for exclusively public purposes.
2. To any corporation, trust, community chest or foundation organized and operated exclusively for religious, charitable, scientific, literary, or educational purposes or for the prevention of cruelty to children or animals, if no part of the net earnings inures to the benefit of any private shareholder or individual.
3. To the special fund for vocational rehabilitation.
4. To posts or organizations of war veterans or auxiliaries thereof, if organized in the United States or its possessions, and if no part of the net earnings inures to any private shareholder or individual.
5. To any fraternal society, order or organization operating under the lodge system, if contributions are used exclusively for religious, charitable, scientific, literary or educational purposes, or for the prevention of cruelty to children or animals.

Non-resident aliens may only deduct contributions to organizations incorporated or created in this country.

Examples of Deductible Contributions.—The following contributions have been held deductible by individuals: contributions or donations to a state university; to a G. A. R. post; organization giving educational musical concerts; Woodrow Wilson Foundation; Harding Memorial Association; Palestine Foundation Fund; Y.M.C.A.; Red Cross; pew rents and dues paid to churches.

Examples of Non-Deductible Contributions.—The Treasury has disallowed contributions to the following: National Dry Federation; Knights of Columbus; public high school for athletic purposes; volunteer fire companies; expenses of delegate to church conference.

REPORTING AND VALUING GIFTS.—When a deduction for contributions is claimed, a statement must be made on or accompanying the return giving the name and address of each organization to which contributions were made,

the amount and the approximate date. When the gift is other than money, the fair market value of the property at the time of gift is deductible. The greatest benefit is therefore obtained by the donation of property which has appreciated in value since acquisition by the donor, since the donor pays no tax on the appreciation and may deduct the full value.

DONATIONS AS BUSINESS EXPENSES.—As hereinbefore stated, corporations may not deduct donations as such, but only when the contributions are in the nature of ordinary and necessary business expenses. If a benefit flows directly to the corporation, donations are deductible. Similarly donations to charitable institutions, hospitals or educational institutions for the benefit of its employees or dependents may be deducted by a corporation. In such cases the donation is a true business expense and deductible as such. Money expended for campaign expenses is not deductible.

PARTNERSHIPS.—No deduction for contributions may be made in the partnership return. However, the individual members may deduct, subject to the 15% limitation, their pro rata share of partnership contributions in their individual returns.

Deductions for Depreciation

DEPRECIATION DEFINED.—The law permits the deduction of a reasonable allowance for the exhaustion, wear and tear of property used in the taxpayer's trade or business, including a reasonable allowance for obsolescence. This deduction is allowed to taxpayers whether on the cash or accrual basis. It cannot be deducted on property, such as a residence, for personal use. Although the law uses the phrase "exhaustion, wear and tear," the usual term applied is "depreciation." The Treasury has defined this word thus: "Depreciation means the gradual reduction in the value of property due to physical deterioration, exhaustion, wear and tear through use in trade or business."

The word "use" in this definition must be interpreted broadly, since depreciation accrues and is deductible even when the property is not in active use, or even if there is no net profit from which to deduct it.

The object of the depreciation allowance is to permit a taxpayer to obtain the return of capital or basis (see below) by the time the property has become worn out. Since an allowance is made annually throughout the estimated useful life of the property, amounts expended in making good the wear and tear cannot also be deducted.

BASIS FOR COMPUTATION.—The asset value upon which depreciation is computed is the same as the basis which would be used in the case of sale of the property. In the case of property acquired after February 28, 1913, the basis is generally cost; for property acquired before that date, the basis is cost or March 1, 1913 value, whichever is higher. To this general rule there are **many exceptions** which have been enumerated under "Income from Sales and Exchanges." Reference thereto should be made to ascertain the basis to be used in particular cases, such as property acquired in a reorganization, by gift, bequest, etc. From the basis as above determined, there must be deducted the estimated **salvage value** of the property at the time it is likely to be discarded. The remaining amount is then distributed over the estimated useful life of the property on some method acceptable to the Treasury.

METHODS OF DETERMINING ALLOWANCE.—Although accountants recognize a number of methods upon which the total depreciation may be distributed over the life of the asset, the Treasury has only recognized, specifi-

cally, **two methods.** This fact should not prevent the deduction of depreciation on some other basis if such method accords with recognized trade practice or if sanctioned by good accounting practice. The method in common use is the **"straight line"** method under which scheme the total depreciation is spread equally over the life of the asset. Thus, if a machine costs $1,200, and is estimated to have a scrap value of $200 and a useful life of ten years, the annual deduction will be one-tenth of $1,000 ($1,200 − $200). The **diminishing balance** method does not find favor with the Treasury. Another method sanctioned by the Treasury is the **apportionment of the total depreciation over units of production.** If the machine referred to in the previous paragraph is believed to be capable of producing 100,000 units of the particular product, there will be deducted in any year the product of the number of units actually manufactured times the fraction $\frac{1.000}{100,000}$. A production in a particular year of 25,000 units will therefore warrant a deduction of $250 in that year. When the total deductions equal the total depreciation previously estimated, no further deductions may be made.

COMPOSITE RATES OF DEPRECIATION.—While some taxpayers maintain records which permit them to compute depreciation for each type of capital asset employed, it is usually **necessary to apply depreciation on general classifications,** such as buildings, machinery, automobiles, etc. This method is not scientifically accurate, but is usually the best solution of the problem. The rate to be applied to each such class of assets will be a composite rate which will not apply to any specific asset, but to the class as a whole. Thus a depreciation rate for machinery of 5, 7½ or 10% might be applied in a particular case, although in that case, a specific machine might have a life of 40 years, while another would be discarded after 5 years.

RATES OF DEPRECIATION.—No categorial statement of depreciation rates can be given which would apply to all cases. Depreciation is essentially **an individual problem.** All relevant factors must be considered. Climate, types of labor, adequacy of repairs and periodical inspections, overtime and overload, type of product, contamination of atmosphere by chemicals, etc., road conditions for trucks, etc.—are all factors to be taken into account. Most industries have rates of depreciation which have been arrived at by trade associations or supervisory commissions. A tabulation of many such rates appears in Montgomery's "Income Tax Procedure," in the "Accountants' Index," in publications of the National Association of Cost Accountants, in various uniform cost systems, and in trade papers. These rates should be given careful study. **Patents and copyrights** should be depreciated over their life unless they become obsolete before expiration when the undepreciated balance may then be charged off. A taxpayer has the option of charging off as an expense when incurred the cost of drawings and patterns or of capitalizing and depreciating such costs.

PROPERTY NOT SUBJECT TO DEPRECIATION ALLOWANCE.—No deduction may be made for the depreciation of land nor of property used as or in connection with a personal residence. The potential earning capacity of an individual is not the subject of a depreciation allowance. The Treasury holds that the roadway of a railroad may not be depreciated. When an aggregate of depreciable and non-depreciable property is acquired (e.g., land and buildings) an allocation must be made so that depreciation is computed only on depreciable assets.

OBSOLESCENCE.—There should be included in the depreciation rate an allowance for any obsolescence which is likely to take place due to changes in the methods of production, new inventions, changes in business localities, etc.

GENERAL.—Depreciable assets do not usually remain fixed in amount throughout the year. If the changes are small in amount, an average of the balances at the beginning and end of the year should be used as a basis for computation of the allowance. If major additions are made, depreciation thereon should be computed from the date of acquisition. To be deductible, depreciation **must be charged off on the books of taxpayers.** An exception is allowed where an individual owns one or two pieces of depreciable property but does not keep books. The depreciation allowed in such a case is "charged off" on the tax return. The allowances must be either deducted from the book value of the assets, or preferably credited to a depreciation reserve to which all renewals and replacements will be charged.

Deductions for Depletion

In order to permit a taxpayer to recover his capital, an allowance is permitted which takes account of the loss of value of natural resources, such as mines, oil wells and timberlands resulting from the removal of the product in question.

BASIS OF COMPUTATION.—With the exception of depletion based upon so-called discovery value, the basis used in computing depletion is the **same as would be used in the sale of the property.** In the case of property acquired after February 28, 1913, this will often be the cost of the property; when acquired before that date, the basis will usually be the cost or March 1, 1913 value, whichever is higher. Other bases are outlined hereinbefore under Income from Sales and Exchanges.

DISCOVERY VALUE.—If as a result of the **discovery of new deposits,** etc., after February 28, 1913, the fair market value of a mine or well becomes seriously disproportionate to the cost, the value of the discovered property based on what is evident within 30 days of the discovery may be used as the basis of depletion. The deposit so discovered must not have been known previously or its existence must have been extremely improbable. The depletion allowance when based upon discovery value may not exceed 50% of the net income (computed without allowance for depletion), except that in no case may the depletion allowance be less than if computed without reference to discovery value.

COMPUTATION OF DEPLETION ALLOWANCE.—To determine the depletion allowance for any year, it is necessary to know (a) the "basis" or basic valuation, (b) the mineral content at the basic date, and (c) the production for the taxable year. The depletion allowance is then $\frac{a}{b} \times c$.

VALUATION.—The major problem in the determination of depletion allowances is the ascertainment of the value and content of the particular mine, well or timberland at the basic date. **Determination of the content** is essentially an engineering problem. As to valuation, the methods employed by the Treasury do not in all cases coincide with those employed by reputable authorities in the particular industry. If possible the Treasury likes to use **actual sales of comparable property.** If, as is usually the case in mines and oil wells, such a method is not feasible, **analytic methods** are employed. The subject is too complicated for discussion here, but it may be said that the method contemplates the determination as of a basic date of the present value of esti-

mated future earnings, due allowance being made for necessary development of the mineral body.

GENERAL.—As with depreciation, allowances for depletion **must be recorded in the taxpayer's books.** This is also true of discovery value when allowed. **Appropriate reserves** will also be set up. When **property is leased,** the depletion allowance must be apportioned equitably between lessor and lessee on the basis of their interests in the property. **Royalties** based on natural resources are subject to an allowance for depletion at the time when received by the true owner. In computing the depletion allowance, the value of surface land must be excluded. Very often this is of comparatively little value. **Very elaborate questionnaires** have to be filed by taxpayers claiming depletion allowances. Copies may be obtained from the Commissioner in Washington.

Other Deductions

Under this heading will be considered a number of deductions, chiefly **business expenses,** not heretofore treated. The law permits the deduction of all ordinary and necessary expenses paid or incurred during the year, including a reasonable allowance for salaries, etc.

SALARIES, WAGES, ETC.—Amounts paid as compensation for personal services may be deducted. However, if compensation is not in fact the purchase price of services, it cannot be deducted. Ostensible salaries, which are in fact distributions of profits, may not be deducted. If such salaries are in proportion to stock holdings, the disallowed part is treated as a dividend paid. Salaries paid must be reasonable; if unreasonable in amount, the inference is that a distribution of profits is contemplated. Bonuses paid to employees are deductible, as are commissions paid salesmen, etc. Christmas gifts may be deducted; also pensions to ex-employees and their dependents. Educational and welfare expenditures are usually a proper deduction. It is not necessary that salaries or other compensation be paid in cash. If employees are given stock or other property as compensation for their services, the fair market value of the stock or other property is deductible as an expense. **Partners' salaries** are in fact distributions of profits. As such, they are not true deductions and should not be shown as such on the partnership return. Any amount designated as salary in a partnership return must of course be included as income by the individual recipient.

INSURANCE.—An individual cannot deduct premiums paid on an insurance policy covering his own life. Corporations and individuals in business may deduct insurance premiums covering fire, theft, storm, accident, employes' liability, credit risk, marine losses, fidelity bonds, also group insurance on the lives of its employees, but the deduction of premiums on the life of an officer or employee where the taxpayer is a beneficiary is not permitted. **Additions to "self-insurance" reserves** may not be deducted. The charges to such reserves are deductible when the liability is incurred. An **award under a workmen's compensation** act is deductible in full when determined, unless covered by insurance.

RENTALS.—Rentals paid in business operations are deductible, whether paid in cash or otherwise. Any payments made under a lease, additional to the rental, are deductible either when made or spread over the life of the lease, depending on the character of the payment. If a lessee erects a building on leased land, the cost thereof will be written off over the life of the lease or of the building whichever is shorter. A similar procedure is adopted for spreading

the cost of improvements over the life of a lease. When a lease is acquired for a specified sum, the cost is to be apportioned over the period of the lease. Taxes paid by a tenant or repairs made by a lessee are deductible if no reimbursement is made by the lessor.

TRAVELING EXPENSES.—A deduction is allowed for traveling expenses (including the entire amount spent for meals and lodging) while an individual is away from home **on trade or business.** Corporations may deduct traveling expenses paid to their employees. Commuters' fares are not deductible. The term "home" is interpreted to include a place of residence in the vicinity of the taxpayer's place of business.

MISCELLANEOUS.—The cost of **upkeep of an automobile** is deductible to the extent which it can be proven to have been used for business. Amounts set up in a **reserve for discounts** may be deducted, any discounts not taken being subsequently returned as income. **Dues paid to chambers of commerce,** etc., are deductible, as are dues to professional societies. **Legal expenses in connection with business** may be deducted unless the Treasury considers that any part thereof falls within the category of lobbying expenses. An individual cannot deduct attorney's fees paid for his defense against a criminal action brought against him as a corporate officer.

Personal Exemptions and Credits

In computing the normal tax for individuals, certain credits and personal exemptions are allowed. Certain credits are allowed to estates and trusts and to corporations.

PERSONAL EXEMPTIONS.—In computing the normal tax for individuals, the personal exemptions are as follows:

Single person	$1,000
Head of a family or married person living with husband or wife	2,500
Estates and trusts	1,000

The personal exemption for a husband and wife living together is $2,500. If they make separate returns the personal exemption may be taken by either or divided between them. The question of whether the personal exemption should be taken by husband or wife or be divided between them, is determined by using the method resulting in the payment of the least combined normal tax. If husband and wife are living apart voluntarily, the $2,500 exemption does not apply, each being treated as a single person.

Head of a Family.—A head of a family is an individual who actually supports and maintains in one household, one or more individuals who are closely connected with him by blood relationship, relationship by marriage, or by adoption, and where the right to exercise family control and provide for these dependent individuals is based upon some moral or legal obligation. If without necessity the dependent makes his or her home elsewhere than with his or her benefactor, the latter is not a head of a family. Thus, a son who supports his widowed mother is a head of a family. But a resident alien whose family is abroad cannot claim the personal exemption of a head of a family.

Change of Status During Year.—If the status of an individual taxpayer changes during the year, the personal exemption is adjusted accordingly. Thus assume a single man marries on August 1. His exemption will be 7/12 of $1,000 plus 5/12 of $2,500, or a total of $1,625. Fractional parts of months less than one-half are disregarded. The total personal exemption taken during a year

by a man and woman who are married for more than one month during that year cannot exceed $2,500.

Return for Fractional Part of Year.—When returns for a period less than a full year are made (except as the result of a voluntary change of fiscal years by taxpayers) the personal exemptions are correspondingly reduced. However, if an individual dies during the year, the full exemption based on his status on the date of death will be allowed in the return filed for such decedent, although such return covers only part of a year.

CREDIT FOR DEPENDENTS.—A credit is allowed in computing the normal tax of individuals (but not of estates, trusts or corporations) of **$400 for each person,** other than husband or wife, who is dependent upon and receiving his chief support from the taxpayer, if such dependent is either (1) under 18, or (2) incapable of self-support because mentally or physically defective. Whether an individual is entitled to this credit depends on his status on the last day of his taxable period. No adjustment is made as a result of change of status during the year. In the case of returns for less than a year (except voluntary change of fiscal year) the credit is correspondingly reduced, except in the case of a decedent whose status at the date of death determines the allowable credit for dependents.

CREDIT FOR DIVIDENDS.—Individuals are allowed, in computing normal tax, a credit for dividends of the following classes:

1. From domestic corporations (except those organized under the China Trade Act, 1922, or which obtain most of their income in a U. S. possession).
2. From foreign corporations, 50% or more of the gross income of which for the preceding 3 years arose from sources within the United States.

Thus, in general, a credit is allowed for dividends received from most domestic corporations and from a few foreign corporations. A taxpayer receiving dividends from a foreign corporation should ascertain their status under the law and report them accordingly.

CREDIT FOR INTEREST.—Since the interest on all obligations of the United States is not subject to normal tax, a credit for the purpose of computing that tax is allowed, to individual taxpayers, of all interest on United States obligations which is included in gross income because subject to the surtax. Included in this class is interest on Liberty bonds (other than 1st 3½'s) on Treasury notes, Treasury certificates of indebtedness, Treasury bonds and war savings certificates. Details will be found under Income from Interest on United States obligations.

SPECIFIC CREDIT TO CORPORATIONS.—Domestic corporations are allowed a **specific credit of $2,000** if the net income is not in excess of $25,000. If the net income is between $25,000 and $25,250, the tax payable shall not exceed the tax which would be payable were the $2,000 credit allowed plus the excess of the net income over $25,000. If the net income exceeds $25,250, no credit is allowed. The application of the credit to corporations whose net income is but little over the $25,000 is shown by the following computations:

Example 1: Corporation A with Net Income in 1924 of $25,100.

(a) The tax, without the specific credit, at 12½%		$3,137.50
(b) Net income of	$25,100.00	
Less, Credit	2,000.00	
Tax at 12½% on	$23,100.00	2,887.50
Excess of (a) over (b)		$ 250.00

As the limitation imposed by the section precludes the tax computed under (a), $3,137.50, exceeding the tax computed under (b), $2,887.50 (an excess of $250), by more than the income in excess of $25,000 ($100), the actual tax in the case of corporation A would be: $2,887.50+$100, or $2,987.50.

Example 2: Corporation B with Net Income in 1924 of $25,300.

(a) The tax, without the specific credit, at 12½%		$3,162.50
(b) Net income of	$25,300.00	
Less, Credit	2,000.00	
Tax at 12½% on	$23,300.00	2,912.50
Excess of (a) over (b)		$ 250.00

In this example the excess of (a) over (b), $250, is not more than the excess of the net income over $25,000 ($300); the actual tax, therefore, of corporation B remains as computed without the specific credit, i.e., $3,162.50. The dividing line below and above which the specific credit of $2,000 is effective or otherwise, is $25,250.

RETURNS FOR FRACTIONAL PART OF YEAR.—Corporations filing returns for a fractional part of a year and having a net income of less than $25,000 for the period are entitled to a proportionate part of the $2,000 credit even though the net income when placed on an annual basis exceeds $25,000.

CHINA TRADE ACT CORPORATIONS.—A special credit is allowed to these corporations; for its amount and computation see the relevant sections of the law.

CREDITS IN PARTNERSHIP AND FIDUCIARY RETURNS.—In order that the individual members or beneficiaries may obtain in their personal returns the benefit of credits arising from partnerships, estates and trusts, the forms provide for the reporting of dividends. As taxable interest on United States obligations is not included as income in partnership or fiduciary returns, members or beneficiaries must be advised directly of the amount of such interest received, so that credit can be taken against the normal tax in their personal returns.

CREDITS FOR EARNED INCOME AND FOR FOREIGN TAXES.—As these credits are direct deductions from the tax otherwise payable and are not deducted from income for the purpose of arriving at the taxable net income, they will be considered under Rates and Computation of Tax, below.

Rates and Computation of Tax

The rate of tax **applicable to corporations** for 1925 is 12½% of its net income less any specific credit which may be allowed. **For individuals,** there are several classes of taxes to be applied in order to compute the total income tax.

NORMAL TAX.—The normal tax is computed on net income less the personal exemption and credit for dependents and less credits for dividends and taxable interest on United States obligations. The rate is 6%, except that for citizens and residents, the first $4,000 of net income in excess of the credits and personal exemptions is taxed at 2% and the next $4,000 at 4%. The following example will make this clear:

Gross income	$500,000
Deductions	380,000
Net income	120,000

Less: Personal exemption	$ 2,500	
Credit for dependents	800	
Dividends	20,500	
Taxable interest on United States obligations	11,200	$ 35,000
Net income subject to normal tax		$ 85,000
Tax on $4.000 at 2%		$ 80
" " 4,000 " 4%		160
" " 77,000 " 6%		4,620
Total normal tax		$ 4,860

SURTAX.—The rates of surtax are applied to the net income, no allowance being made for personal exemptions, or for credits. The rates for the year 1924 are as follows, unless changed by Congress prior to March 15, 1926. For rates applicable to years subsequent to 1924, reference should be made to the current Revenue Act.

1924 Surtax Rates

Amount of net income	Rate per cent	Total surtax on each amount	Amount of net income	Rate per cent	Total surtax on each amount
A	B	C	A	B	C
$10,000	.....	.....	$ 62,000	21	$ 5,900
14,000	1	$ 40	64,000	22	6,340
16,000	2	80	66,000	23	6,800
18,000	3	140	68,000	24	7,280
20,000	4	220	70,000	25	7,780
22,000	5	320	74,000	26	8,820
24,000	6	440	76,000	27	9,360
26,000	7	580	80,000	28	10,480
28,000	8	740	82,000	29	11,060
30,000	9	920	84,000	30	11,660
34,000	10	1,320	88,000	31	12,900
36,000	11	1,540	90,000	32	13,540
38,000	12	1,780	92,000	33	14,200
42,000	13	2,300	94,000	34	14,880
44,000	14	2,580	96,000	35	15,580
46,000	15	2,880	100,000	36	17,020
48,000	16	3,200	200,000	37	54,020
50,000	17	3,540	300,000	38	92,020
52,000	18	3,900	500,000	39	170,020
56,000	19	4,660	500,000+	40	.....
58,000	20	5,060	.....	.....	.....

To illustrate the use of this table, the surtax of the taxpayer whose normal tax has been computed above can be ascertained.

Net income	$120,000
Surtax on $100,000	$ 17,020
Surtax on 20,000 at 37%	7,400
$120,000	
Total surtax	$ 24,420

TAX ON CAPITAL NET GAIN.—The rate of tax applied to capital net gains in lieu of both normal and surtaxes is, under the 1924 law, 12½%. The normal and surtax on ordinary net income (i.e., excluding the capital net gain) is computed in the ordinary way. There is then added thereto 12½% of the capital net gain. If it is assumed that the gross income given in the example

above excludes a capital net gain of $100,000, there will be added to the normal and surtax as computed above, 12½% of $100,000 or $12,500. Since the application of the capital net gain is optional with the taxpayer, this procedure is only used when it is to the pecuniary advantage of the taxpayer. If the provision is not invoked, the capital net gain is included in gross income.

CAPITAL NET LOSS.—When a taxpayer has a capital net loss, he cannot reduce his tax by more than 12½% of the loss. The normal and surtax is computed on ordinary net income (i.e., computed without deducting the capital net loss) in the usual way. There is then deducted 12½% of the capital net loss. However, the tax so computed cannot be less than the tax computed in the usual way after the capital net loss has been deducted from the ordinary net income. In the example used above, assume that the capital net loss has not been considered and that it amounts to $8,000. From the normal and surtax as computed above there will be deducted 12½% of $8,000, or $1,000.

EARNED INCOME CREDIT.—The 1924 law provides for taxing so-called earned income, up to a maximum of $10,000, at a lower rate than other income. As heretofore stated, if the net income of an individual is less than $5,000, it is all considered as earned and even if the net income exceeds $5,000, the amount of earned income will not be considered as less than that amount. The **maximum allowance** is $10,000. Deductions properly applicable to the earned income must be subtracted therefrom. The earned income credit is a deduction from the tax as ordinarily computed. The credit is one-quarter of the tax on the earned income, assuming that it was the whole of the taxpayer's net income. Thus, everyone obtains an earned income credit, except those whose income arises entirely from sources not subject to normal tax, such as dividends, etc.

Assume that a taxpayer whose tax has been computed above, had included in gross income his income from a law firm amounting to $20,000, the earned income credit would be computed thus:

Earned income (maximum)		$10,000
Less: Personal exemption	$2,500	
Credit for dependents	800	3,300
		$ 6,700
Tax on $4,000 at 2%		$ 80
" " 2,700 " 4%		108
$6,700		
Total tax		$ 188
Earned income credit (25%)		$ 47

The taxpayer would deduct $47 from his tax as otherwise computed.

CREDIT FOR FOREIGN TAXES.—Citizens paying income and profits taxes to foreign countries or to possessions of the United States, residents paying such taxes to possessions of the United States, also residents paying such taxes to a foreign country (if their country of origin allows a similar credit to United States citizens resident therein), may obtain a deduction from their federal income tax as otherwise computed, known as the credit for foreign taxes. The amount of the credit is that proportion of the United States tax computed on the basis of the taxpayer's net income (without any deduction for any part of the foreign income and profits taxes) which the taxpayer's net income from sources without the United States (without any deductions for foreign income and profits taxes) bears to his total net income (without any deduction for foreign income and profits taxes). As an **example** of the computation of this credit the following official example may be considered:

Income from sources within the United States	$50,000
Income from sources without the United States	25,000
Total net income (without deduction of income and profits taxes paid or accrued to foreign countries or possessions of the United States)	$75,000
United States normal tax and surtax on $75,000	$13,290
Foreign income and profits taxes upon $25,000	5,000
Amount which may be credited against the United States tax ($\frac{25,000}{75,000}$ of $13,290)	$ 4,430

That part of the foreign taxes which is not allowed as a credit may be taken as a deduction from gross income. A recomputation of normal and surtax is required but not of the credit for foreign taxes.

In order to obtain the credit, form 1116 must be filed by individuals and form 1118 by corporations. Since accrued but unpaid foreign taxes may be the basis of the credit, a bond may be required in some cases. Taxpayers whether on the cash or accrual basis may obtain the foreign tax credit on the basis of accruing foreign taxes if so desired. An option once exercised controls future procedure. By taking advantage of the option, it is possible to obtain the foreign tax credit in the same year as the foreign income is returned for taxation. If a domestic corporation owns a majority of the voting stock of a foreign corporation it may obtain a tax credit in respect of foreign income and profits taxes paid by the foreign corporation. The credit consists of the same proportion of the foreign tax which the dividends received bears to the accumulated profits on which the foreign tax was paid or had accrued. The credit is subject to the same percentage limitation as outlined previously.

CREDIT FOR TAXES PAID AT SOURCE.—A deduction from the tax as otherwise computed may be made for any tax deducted at the source, including the 2% tax on tax-free covenant bonds.

RETURNS FOR LESS THAN A YEAR.—When as a result of a voluntary change of fiscal year by a taxpayer, a return is required for a fractional part of a year, the income has to be placed on an annual basis and taxed accordingly. This results in the payment by individuals of tax at a higher rate than would apply if the income were not placed on an annual basis, due to the stepping up of surtaxes. It makes no difference to corporations.

As an **example** of the necessary computation consider the following:

Net Income for 6 months	$20,000	
Placed on annual basis, $20,000 × 12/6	40,000	
Exemption: married (3 children)	3,700	
	$36,300	
Taxable at 2%	4,000	$ 80
Taxable at 4%	4,000	160
Taxable at 6%	28,300	1,698
	$36,300	
Surtax on $40,000		2,040
Total tax		$3,978
Divided by 2		$1,989
Less: Earned Income Credit:		
Earned Net Income, say	$ 5,000	
Exemption	3,700	
	$ 1,300	
Tax on $1,300 at 2%	$ 26	
25% of $26		6.50
Total tax payable		$1,982.50

Dividends and interest are also to be placed on an annual basis in such a case as the above. This procedure is only required when the return for a fractional part of a year results from the voluntary act of the taxpayer. In other cases, the tax is computed on the actual net income for the fractional period, the personal exemption and credit for dependents being proportionately reduced. In the special case of the return for a decedent for the fractional period since the end of his last taxable year to the date of his death, the tax is computed on the actual income, full credits and personal exemption being allowed. Since no tax is payable on partnership returns, the income does not have to be placed on the annual basis even if the fiscal year is voluntarily changed. The returns of fiduciaries follow the same principles as those of individual taxpayers.

FISCAL YEARS WHEN TAX RATES OR DEFINITIONS OF INCOME CHANGE.—Taxpayers reporting on a fiscal year basis have their tax problems complicated whenever changes are made in tax rates or when changes are made in the definition of income or allowance of deductions, since such changes are usually effective as of January 1. When such conditions occur **two computations** have to be made, the first under the earlier law and tax rates and the second under the later law and tax rates. In both computations the income for the full fiscal year is used. The tax payable is the sum of the proportionate parts of the sums so computed based on the number of months falling in each of the two calendar years.

As an example, consider the following, where the fiscal year ends June 30, 1924:

Income 1923 basis	$60,000	
Tax 1923 rates	8,955	
Income 1924 basis	50,000	
Tax 1924 rates	$ 6,095	
Tax applicable to six months in 1923		$4,477.50
Tax applicable to six months in 1924		3,047.50
Total tax for fiscal year		$7,525.00

PARTNERSHIPS HAVING FISCAL YEARS WHEN RATES CHANGE.—An even more complicated problem arises when an individual receives income from a partnership having a fiscal year when rates or the definition of income changes. This is due to the fact that the income arising under the earlier law is taxed to the individual at the rates then in force but by super-imposition upon the income applicable to the later law.

An example will make clear the working of this regulation.

Example: It is assumed that A, filing his return on a calendar year basis, has a one-fourth interest in a partnership with fiscal year ended June 30, 1924, that owing to differences between the 1921 and 1924 laws, the net income of the partnership is less when computed under the 1924 law than it is under the 1921 law, and that at least $10,000 of A's income is "earned net income."

Partnership income, 12 months ended June 30, 1924, as computed under 1924 law		$100,000
Partnership income, 12 months ended June 30, 1924, as computed under 1921 law		120,000
Partnership income taxable at 1923 rates—½ of $120,000	$60,000	
A's share—¼ taxable at 1923 rates		15,000
Partnership income taxable at 1924 rates—½ of $100,000	$50,000	
A's share—¼		$ 12,500
Other income in calendar year 1924		20,000
Total income taxable at 1924 rates		$ 32,500

The tax is computed as follows:			
Net income taxable at 1924 rates		$32,500	
Less exemption		2,500	
		$30,000	
Taxable at 2%	$ 4,000		$ 80
Taxable at 4%	4,000		160
Taxable at 6%	22,000		1,320
	$30,000		
Surtax at 1924 rates on $32,500			1,170
			$ 2,730
Earned net income credit:			
Maximum earned income under law	$10,000		
Less exemption	2,500		
	$ 7,500		
Taxable at 2%	4,000	$ 80	
Taxable at 4%	3,500	140	
	$ 7,500		
Tax payable if earned income were total income		$ 220	
Earned net income credit, 25% of $220			55
Total tax at 1924 rates			$ 2,675
Net income taxable at 1923 rates	$15,000		
Normal tax at 8%		$ 1,200	
Surtax at 1923 rates:			
On total income of $47,500	4,415		
On income taxable at 1924 rates, $32,500	1,775		
Surtax on $15,000 in higher brackets		2,640	
Total tax at 1923 rates			3,840
Total tax payable by A for calendar year 1924			$ 6,515

The 25% credit for reduction of 1923 tax under section 1201 (b) does not apply in this case. While the partnership return includes income earned in 1923, the return of the taxpayer in this case is for the calendar year 1924. The 25% credit applies to 1923 returns or the fiscal year return of a taxpayer falling partly in 1923. A partnership as such is not a taxpayer. In the example above, the taxpayer would, of course, be entitled to credit for 25% of the tax shown on his 1923 return, although he may have included therein partnership income partly accumulated in 1922.

Payment of Tax

Federal income tax is payable on March 15 following the close of the calendar year, or in the case of a fiscal year return, on the 15th day of the 3rd month following the close of such year. Thus the first payment is due on the same day as that on which returns must be filed. Although the tax is payable as aforesaid, calendar year taxpayers may elect to pay the amount in **four equal quarterly instalments** on March 15, June 15, September 15 and December 15. Corresponding dates apply in the case of fiscal year returns. Failure to pay any instalment on the due date may cause the unpaid balance to become due and payable upon notice and demand from the collector. No notice and demand is made in respect of the first instalment but notices are generally sent for the succeeding instalments. The fact that no notice is received does not excuse failure to pay on the due date. Taxpayers should preserve carefully the checks issued in payment of federal taxes so as to avoid the possibility of

having to pay the same item twice. If payment is made in cash taxpayers should insist on a receipt. It is not too long to keep evidences of tax payments for 10 years.

EXTENSIONS OF TIME.—The Commissioner is authorized to extend the time for payment of tax for a period not to exceed 6 months. Interest at 6% per annum is payable in respect of such extension. This provision applies only to the tax shown on original returns and not to an additional assessment. If a taxpayer can satisfy the Commissioner that the payment of an additional assessment will impose a hardship, the Commissioner may grant an extension of time for such payment, or part thereof, not to exceed 18 months. A bond will be required, not to exceed double the amount of unpaid tax. In lieu of a bond, United States obligations may be deposited in escrow. Interest at 6% per annum is payable in respect of such extensions. Extensions will not be granted where the additional assessment arises from negligence, intentional disregard of rules and regulations, or to fraud with intent to evade tax. If the tax is not paid at or before the expiration of the extension, interest thereafter will accrue at the rate of 1% per month.

MEDIA OF PAYMENT.—The tax may be paid in **cash** or in **certain issues of Treasury notes or certificates of indebtedness at par.** Collectors may accept certified or uncertified checks, but the responsibility of the taxpayer remains until the check is paid by the bank.

CORPORATIONS IN DISSOLUTION.—If a corporation dissolves and distributes all of its assets prior to receiving notice of an additional assessment, the tax may be collected by suit against the stockholders to the extent of any assets received in dissolution.

PAYMENTS BY FIDUCIARIES.—Liability for payment of tax attaches to the person of a fiduciary up to and after his discharge, where prior to distribution and discharge he had notice of the tax due or failed to exercise due diligence in ascertaining whether any such obligation existed.

PROTEST.—It was necessary formerly that taxes be paid under protest if subsequent suit for recovery was commenced. This is no longer necessary. However, if taxpayers so desire, taxes may be paid under protest by writing the words, "Paid under protest," plainly across the face of the check or by a protest contained in a letter of transmittal to the collector.

COMPROMISE OF PAYMENT.—The commissioner has power to compromise taxes due, interest and penalties. Compromises are considered when the payment of an additional assessment would **force a taxpayer into bankruptcy,** but when, if reduced in amount, it would be possible for the taxpayer to continue in business. **Excessive interest** may also be the subject of offers in compromise. **Technical offenses,** such as delay in filing returns, result in penalties. If such delay was not willful, the penalties may usually be compromised for $5 or $10. A special form is provided on which offers in compromise are submitted by taxpayers through the local collectors of internal revenue.

Additional Assessments and Appeal Procedure

AUDITING PROCEDURE.—The relationship of the various steps in determining a taxpayer's liability to additional tax is best understood from a consideration of the procedure followed in auditing returns.

When a taxpayer's return is received in the local collector's office, it is scrutinized for any obvious errors. The returns showing the larger net incomes are

listed and sent to the Bureau of Internal Revenue, Washington, D. C.; returns with small incomes are retained in the collector's office and audited in a way similar to that described for the larger returns. In due course **field agents** are sent out to verify the accuracy of the larger returns by inspection of taxpayer's records. Only one such examination for each year's return is permitted without written notification from the Commissioner that further examinations are necessary. In the case of the small returns, taxpayers are requested to visit the local collector's office to explain any items which the collector's staff consider questionable. It should not be overlooked that the small taxpayer has the same rights of appeal as taxpayers whose returns are sent to Washington.

Following the examination of returns by field agents, taxpayers receive **copies of the revenue agents' reports.** If an additional tax is shown to be due, the taxpayer may, within 30 days, file a protest with the local collector. A hearing may be requested in the protest. Full details should be given in the protest in support of the taxpayer's position. After considering the protest, the collector's office sends the file to the Bureau of Internal Revenue, either with a new report acquiescing in the taxpayer's contentions or with the original report and the taxpayer's protest.

When the file is received in Washington, the case is considered in the light of all evidence there available. If no additional tax is considered to be due, the taxpayer may or may not be informed. If an additional tax is proposed by the Treasury, the taxpayer is notified by an assessment letter. From the date of this letter, the taxpayer has 30 days to present a **protest to the Commissioner.** A hearing may be requested. The protest need only be a formal statement of alleged errors and brief reasons why they should be adjusted. Full details must be filed with the Bureau within 25 days after the protest was due or 5 days before the date set for a hearing.

If after consideration of the protest, supplemented by a hearing if requested, the taxpayer's contentions are allowed in whole or in part, he will be so informed by letter. To the extent that a taxpayer's contentions are disallowed, the Commissioner is said to "determine a deficiency," and the letter announcing his determination is called a "deficiency" or "60-day" letter. Within 60 days of the date of this letter, the taxpayer may file a petition to the **United States Board of Tax Appeals** (described later). The Board's decision is binding on the Commissioner as far as the assessment of the tax is concerned. If the board decides in the taxpayer's favor, the tax cannot legally be assessed, but the Commissioner must sue in the federal courts for its recovery. A decision in whole or in part against the taxpayer authorizes the Commissioner to assess the corresponding additional tax.

The additional tax is demanded by the local collector on receipt of assessment lists from the Commissioner. The tax is payable within 10 days of notice and demand; delinquent interest and penalties accrue if the tax is not paid when due. There is no way of postponing payment of an additional tax assessed after a taxpayer has had the right to appeal, as outlined above, whether he has taken advantage of it or not, except the extension which may be allowed when payment immediately would cause a hardship.

STATUTORY LIMITATION ON ASSESSMENTS.—Any additional tax must be assessed by the Commissioner **within 4 years** after the relevant final (not tentative) return was filed, except under acts prior to 1921 when the period was 5 years. This period is extended by 60 days if a deficiency letter has been mailed to the taxpayer and if no appeal is taken to the Board of Tax Appeals, or if an appeal is filed, by the number of days from the date of the deficiency letter to the date of final decision by the Board. Additional tax in

the case of a false or fraudulent return with intent to evade tax may be assessed at any time without limitation. This is also true of the determination of allowances for amortization of war facilities.

The statutory period for assessment may be extended by the filing of a waiver by the taxpayer. This is often necessary to avoid a jeopardy assessment. Upon written request by an executor or administrator, the Commissioner must determine and assess any additional tax resulting from the decedent's returns within one year thereof. It should be noted that "assessment" signifies the placing of the tax on a list and signature by the Commissioner. This is often some weeks prior to the receipt of a notice from the local collector.

JEOPARDY ASSESSMENTS.—Under the law an additional tax cannot legally be assessed until the taxpayer has had the right of appeal to the Board of Tax Appeals. However, there is a much abused provision which allows assessment before appeal when the Commissioner believes that the assessment or collection will be jeopardized by delay. This provision is usually invoked when the statutory period is running out and the audit of return is not complete. The taxpayer is often given the option of signing a waiver or receiving a jeopardy assessment.

If a jeopardy assessment is made, the taxpayer may file a claim in abatement accompanied by a bond not exceeding twice the tax assessed. Thereafter he will be accorded the right of appeal to the Board of Tax Appeals. If the taxpayer cannot furnish a bond, the tax must be paid although no appeal has been heard. Action for recovery must then be brought in the federal courts after filing a claim for refund.

INTEREST ON ADDITIONAL ASSESSMENTS.—Interest is payable at 6% per annum on additional taxes assessed in respect of the years 1921 to 1923 inclusive, from the original due date to the date of notice and demand by the collector and in respect of 1924 and subsequent years, from the due date to the date of assessment by the Commissioner. Additional assessments arising under laws prior to 1921 do not bear interest, unless claims for abatement were filed, when interest, in most cases at 6% per annum, is payable from the date of filing such claim until the date of payment.

BOARD OF TAX APPEALS.—The United States Board of Tax Appeals is a quasi-judicial body established under the 1924 law for the purpose of giving taxpayers an opportunity for an impartial hearing before the payment of additional tax. It passes on cases arising under deficiencies of income tax and federal estate tax determined by the Commissioner, and under determinations made by the Commissioner after June 2, 1924, on claims for abatement (including jeopardy assessments).

The procedure comprises the filing of a petition with the board within 60 days from the mailing date of the Commissioner's deficiency letter or determination under a claim for abatement. An answer is filed by the Solicitor of Internal Revenue. In due course the case is argued before a division of the Board or before the whole Board. Rules of evidence are strictly followed. Decisions are made in all cases, but opinions are only required when the deficiency exceeds $10,000. Since the procedure is similar to court practice, taxpayers are advised to have appeals handled by experienced practitioners. There is, however, no inhibition against a taxpayer handling his own case. Only attorneys and certified public accountants may represent taxpayers before the Board. If a decision of the Board is in favor of the taxpayer, the Commissioner cannot legally assess the additional tax. The Commissioner's remedy is by suit in the federal courts, which must be begun within one year of the Board's decision.

As the rules of the board are being changed from time to time, and as the procedure is highly technical, those desiring complete information should consult "Montgomery's Income Tax Procedure."

DISTRAINT.—If a taxpayer fails to pay an assessment within 10 days of a notice and demand, a second notice is usually sent. Failure to pay usually results in the issuance of a distraint warrant with or without the filing in the district court of a lien against the taxpayer's realty. Such proceedings must be begun within 6 years after the assessment of the tax. If begun after that period, the proceeding is illegal and the tax paid thereunder may be recovered. This limitation period also applies to suits by the Commissioner for the recovery of taxes, except when such suit follows an adverse decision of the Board of Tax Appeals.

FINAL DETERMINATIONS.—After a determination of a taxpayer's liability, an agreement may be entered into in writing between the Commissioner and the taxpayer that such determination shall be final. Thereafter the case cannot be reopened except upon a showing of fraud or misrepresentation. A formal request is made to the Commissioner for such an agreement.

Claims for Refund, Credit, Abatement—Suits

If a taxpayer believes that he has overpaid his tax for any year, he may file a claim for refund or credit.

CLAIMS FOR REFUND.—Form 843 is used and all relevant facts are recited thereon under oath. Separate claims should be filed for each year. Claims are filed with the collector to whom the tax in question was paid, even if the taxpayer is now in another district. The filing of claims for refund is a condition precedent to suit for recovery of taxes overpaid.

LIMITATION PERIODS FOR REFUND CLAIMS.—The law provides certain periods during which refund claims must be filed. If not filed within such periods, the overpaid tax cannot be recovered. The limitations are as follows:

1921 and subsequent years—4 years from date of payment.
1920—5 years from due date of return.
1919—5 years from due date of return or April 1, 1926 if waiver filed on or before June 15, 1925 or April 1, 1927 if such waiver extended before expiration.
1918—5 years from due date of return or April 1, 1925, if waiver filed on or before June 15, 1924 or April 1, 1926 if such waiver extended before expiration.
1917—5 years from due date of return or April 1, 1925 if waiver filed within 5 years from due date of return or April 1, 1926 if such waiver was extended before expiration.

There is no limitation of time during which the Commissioner may make refund of taxes overpaid for any year as a result of deductions not taken in such year, which cause a reduction of invested capital in any of the years 1917 to 1921 inclusive. The Commissioner may allow the refund of taxes overpaid without the filing of any claim, if such allowance is made within the statutory period as above stated. Too much reliance should not be placed on apparent overassessments shown by Treasury letters. Safety counsels the filing of a claim for refund. The filing of claims for refund within the statutory period permits the Commissioner to repay at any time taxes previously overpaid.

REOPENING CLAIMS.—A claim for refund heretofore disallowed may be reconsidered by the Commissioner upon application setting forth that a court decision acquiesced in by the Treasury has been rendered, or that the Treasury practice has been changed by subsequent regulations, rulings or decisions. By filing claims for refund, taxpayers will obtain the advantages arising from subsequent favorable decisions; if the claim had not been filed, the statute of limitations might prevent the repayment of the admittedly overpaid tax.

INTEREST ON REFUNDS.—When a refund is allowed interest is payable to the taxpayer at 6% per annum from the date of overpayment of the tax to the date of allowance by the Commissioner.

LIMITATION ON AMOUNT OF REFUND.—No refund may exceed the tax paid during the four years preceding the filing of the claim. This means that a claim filed on the basis of the refund of an additional assessment is limited to the amount of the assessment and that none of the original tax can be recovered unless the claim is filed within 4 years of the original payment. This limitation does not apply to claims for refund for any of the years 1917, 1918 or 1919 filed within the extended periods allowed to taxpayers who filed waivers nor to refunds resulting from the reduction of invested capital by the Commissioner due to the fact that certain deductions were not taken in prior years. Furthermore, any claim filed prior to June 2, 1924, which would have been allowable at the time of filing but for this limitation will not be subjected to the limitation, nor will a claim for 1920 filed within 5 years after the due date of the return.

CLAIMS FOR CREDIT.—When there has been an overpayment of taxes for one year such overpayment, by means of a claim for credit, may, in some cases, be applied in reduction of the tax liability of another year. The adjustment is considered temporary until the claim for credit is allowed by the Commissioner. However, the use of the claim for credit is so restricted that it can be considered almost non-existent for most taxpayers. The form used is the same as for refund claims—form 843—and similar information is required. A bond or other security may be demanded by the collector with whom the claim is filed. Interest is allowed on claims for credit from the date of overpayment to the date when applied by the taxpayer in reduction of another year's tax liability. The statutory period within which claims for credit must be filed are the same as those for refund claims heretofore stated.

CLAIMS FOR ABATEMENT.—These claims, on form 843, can now be filed only when so-called jeopardy assessments (assessments made before taxpayer has had the right of appeal) are made. When assessments other than jeopardy assessments are made, the amount thereof must be paid on demand. Claims for abatement must be accompanied by a bond not exceeding twice the amount of the claim. When so filed, no further action will be taken to collect tax until the Board of Tax Appeals has decided the case. Interest at 6% per annum is payable on the disallowed part of a claim for abatement.

SUITS BY TAXPAYER.—Before a taxpayer may sue in the federal courts for the recovery of tax overpaid or illegally collected, **a claim for refund or credit** must have been filed within the statutory period for such claims. Payment of the tax under protest is no longer required. No suit can be commenced before the expiration of six months after the filing of the claim for refund unless the Commissioner renders a decision on the claim before that time. Suit cannot be commenced after 5 years from the date of payment of the tax or after 2 years from the rejection of a claim for refund by the Commissioner —whichever is later. The Commissioner must notify the taxpayer of the

rejection of a claim for refund within 90 days of the disallowance. State courts have no jurisdiction over refunds of federal taxes, so that suits must be commenced either in the Court of Claims of the United States or in a United States District Court.

Penalties

A number of penalties for various offenses are provided by the Revenue Act and also by the Revised Statutes. Only a few of these can be considered here.

UNDERSTATEMENT OF TAX.—If due to negligence or intentional disregard of rules and regulations—5% of deficiency.

If due to false or fraudulent return with intent to evade tax—50% of deficiency.

FILING RETURNS, COLLECTING TAXES, ETC.—Willful failure to pay tax, make any return, keep record, supply information—maximum fine $10,000 or maximum imprisonment one year, or both, with costs.

Willful failure to collect or account for tax, or willful attempt to evade or defeat tax—maximum fine $10,000 or maximum imprisonment 5 years, or both, with costs.

Willfully aiding in preparation of false or fraudulent return, affidavit or of advising the preparation of such false or fraudulent return, maximum fine $10,000 or maximum imprisonment 5 years, or both, with costs.

Failure to make return unless delay due to reasonable cause—25% of amount of tax.

FAILURE TO PAY TAX WHEN DUE.—An interest penalty of 1% per month is imposed when tax is not paid when due, whether on original return, after extension or after notice and demand. In the case of estates of incompetent, deceased or insolvent persons, only 6% per annum is charged.

COMPROMISE.—As heretofore stated, the Commissioner will consider the compromise of penalties and interest if an offer is made by the taxpayer.

Information Returns and Withholding

Certain information returns have to be filed by individuals and corporations. Tax at specified rates is to be withheld by the payor on payments to certain classes of individuals.

PAYMENTS OF $1,000.—All persons making payment to another person of fixed or determinable income (explained hereinafter) of $1,000 or over in any calendar year must make a return thereof to the Commissioner on or before March 15 of the following year. The return is on form 1099 accompanied by form 1096 showing the number of forms 1099 filed.

FIXED OR DETERMINABLE INCOME.—Income is fixed when it is to be paid in amounts definitely predetermined. It is determinable when a basis for calculation exists. Among income falling within these classifications are interest, rent, salaries, wages, commissions, premiums, annuities, compensations, remunerations, emoluments and royalties.

PAYMENTS NOT REQUIRING RETURNS.—Payments of the following classes need not be reported on information returns: payments of any kind to corporations, bills paid for merchandise, telegrams, telephones, freight, storage, for special services and similar charges; payments to real estate agents (but the agents report payments to landlords); payments by a broker to his customers; payments made by foreign branches of business houses to alien employees

serving in foreign countries. Since withholding returns have to be made in the case of payments to non-resident aliens, to partnerships having one or more non-resident alien members and having no office or place of business in this country and to foreign corporations not engaged in business in the United States, nor having any office or place of business in this country, information returns are not required as to such payments.

RETURN OF DIVIDENDS.—A return is now required annually on March 15 of dividends paid by corporations to stockholders. Payments of less than $500 need not be reported, otherwise the name and address of each stockholder with the amount paid must be furnished.

WITHHOLDING TAX AT SOURCE.—In general, withholding is required—

1. Of a tax of 6% in the case of fixed or determinable annual or periodical income payable to a non-resident alien individual or to a partnership not engaged in trade or business within the United States and not having any office or place of business therein, and composed in whole or in part of non-resident alien individuals, except—
   (a) Dividends of a class allowed as a credit.
   (b) Interest on deposits with persons carrying on the banking business, paid to persons not engaged in business in the United States and not having any office or place of business therein.
   (c) Interest upon corporate bonds with tax-free covenant clause.
2. Of a tax of 12½% in the case of fixed or determinable annual or periodical income (with the exceptions just stated) payable to a foreign corporation not engaged in trade or business within the United States and not having any office or place of business therein.
3. Of a tax of 2% in the case of interest payable to an individual or a partnership, whether resident or non-resident, or to a foreign corporation not engaged in trade or business within the United States and not having any office or place of business therein, upon bonds or other obligations of domestic or resident foreign corporations containing a so-called tax-free covenant clause.

EXEMPTION FROM WITHHOLDING.—A citizen or resident alien owning tax-free covenant bonds may obtain exemption from withholding by filing with the withholding agent form 1001 on or before February 1 of the following year. A resident alien should also file a certificate of residence on form 1078. No ownership certificate is required for interest on bonds not containing a tax-free covenant.

RETURNS OF TAX WITHHELD.—Withholding agents file monthly returns on form 1012 and forward ownership certificates to the Commissioner therewith. Annual returns on form 1013 are required on or before March 15. These returns are also filed with the Commissioner. An annual return on form 1042 is filed with the local collector on or before March 15. The tax withheld must be paid to the collector on or before June 15.

Publicity of Returns

Tax returns are public records and may only be inspected under orders issued by the President. **Individual returns** may be inspected by the taxpayer who made the return or his attorney; by his executor if the taxpayer has died; by heirs or next of kin. A **joint return of husband or wife** may be inspected by

either or by the executor of either. **Partnership's returns** may be inspected by any member thereof at the time covered by the return or by his executor or by his heirs or next of kin. **Estate returns** are open to inspection by the executor etc., or by heirs or next of kin. **Trust returns** may be inspected by the trustees, by a beneficiary or his executor, etc., or by heirs at law or next of kin having an interest therein. **Corporate returns** may be inspected by the president, vice-president, secretary or treasurer. Such returns may also be inspected by bona fide stockholders who are the owners of 1% or more of the outstanding stock.

Certain congressional committees may also examine returns filed by taxpayers. Proper officers of states may be given access to corporate (not individual) returns. Copies of returns may be furnished in court proceedings where the United States is an interested party or to a United States grand jury. Commencing with 1924, the name, address and amount of tax of every taxpayer is made public by the Commissioner through the local collectors. Unofficial disclosure of information acquired in the inspection of returns is forbidden under severe penalties.

Tax on Accumulated Surplus

If a corporation is formed or availed of for the purpose of preventing the imposition of a surtax on its stockholders by accumulating its profits to an unreasonable extent, instead of distributing them, a tax of 50% shall be paid on its "net income." This is in addition to the usual 12½% corporation tax. For the purpose of this tax "net income" includes dividends usually deductible and also the amount of interest on United States obligations issued since September 1, 1917. The fact that a corporation is a mere holding or investment company, or that profits are allowed to accumulate beyond the reasonable needs of the business is *prima facie* evidence of intent to escape the surtax. This presumption can be rebutted by a showing that the funds are required for present or future needs of the business. In other cases the payment of reasonable dividends is the best indication of intention. The retirement of preferred stock is a legitimate use for surplus earnings.

FEDERAL ESTATE TAXATION

NATURE OF TAX.—The present federal estate tax is an excise tax upon the right of every decedent to transfer his property at or in contemplation of death. It is not a tax on the property transferred and it differs from most of the state taxes on decedent's estates in that it is measured by the net estate as a unit, rather than by the distributive shares of the heirs or beneficiaries.

DEFINITION OF RESIDENTS AND NON-RESIDENTS.—For the purposes of the law, decedents are classified either as residents or non-residents without respect to citizenship. A resident is one who, at the time of his death, had his domicile in one of the states of the United States, or in Alaska, Hawaii or the District of Columbia, or one who was a citizen of the United States and with respect to whose property any probate or administrative proceedings are had in the United States Court for China. Foreign missionaries who were domiciled in the United States at the time they departed for the missionary field are presumed to be residents. All other foreign missionaries are non-residents.

Determination of Tax Liability

Every non-resident estate and every resident estate where the net estate is of a **value in excess of $50,000,** is subject to the tax at graduated rates.

RATES OF TAX.—The rates to be applied in any given case depend upon the statute which was in effect at the time of the decedent's death. On page 1627 will be found a table giving the rates applicable under the various acts, together with the periods covered by those acts.

GROSS ESTATE.—In the case of residents the value at the time of death of all property (except real property situated outside of the United States) which is subject to the payment of charges against the estate and the expenses of administration and subject to distribution as a part of the estate, should be included in the gross estate. In the case of non-residents the value of all property situated within the United States should be included. Real estate and stocks and bonds, physically located in the United States at the time of death, moneys due on open accounts by domestic debtors and stocks of corporations or associations of the United States, constitute property having a situs within the United States. The value of so-called tax-exempt bonds must be included in the gross estate.

Dower and Courtesy.—Dower and courtesy and all interests created by statute in lieu thereof are parts of the gross estates of decedents dying after 6:55 P. M., Washington time, February 24, 1919 (the effective date of the estate tax provisions of the Revenue Act of 1918).

Transfers in Contemplation of Death.—For the purposes of the law all transfers by the decedent during his lifetime, except bona fide sales for a valuable consideration in money or money's worth, in contemplation of or intended to take effect at or after death, are a part of the gross estate. Any transfer of a material part of the decedent's property within 2 years of death is presumed to have been made in contemplation of death. This presumption, however, may be rebutted.

Revocable Trusts.—Similarly any transfer or trust made by the decedent in his lifetime where the decedent at the time of his death had the right to alter, amend or revoke the transfer or trust or where such a right was relinquished in contemplation of death, is a part of the gross estate. In the case of a non-resident, if the property transferred or placed in trust was situated in the United States either at the time of transfer or at the time of death, the property so transferred is to be included in his gross estate.

Property Held Jointly.—Where property was held by the decedent and another, either as joint tenants or tenants by the entirety, the entire value of the property is prima facie a part of the decedent's estate. If the surviving tenant can show, however, that all or any part of the property or the consideration with which it was acquired was, at any time, transferred to the decedent by the survivor without fair consideration in money or money's worth, the value of such part is to be excluded. If property held by the entireties was acquired by gift or inheritance, only one-half of its value is to be included in the gross estate and if property held jointly was so acquired then only that portion is to be included to which the decedent would have been entitled in partition.

Powers of Appointment.—If the decedent exercised a general power of appointment theretofore vested in him, either by will or by deed executed in

contemplation of death, the value of the property affected by the power is a part of the gross estate.

Insurance.—Insurance payable to the decedent's estate is a part of the gross estate for the purposes of taxation. Insurance payable to others is to be included to the extent that it exceeds $40,000 in amount.

Deductions from Gross Estate—Residents.—In arriving at the net estate in the case of a resident decedent the following deductions should be made from the value of the gross estate:

1. Funeral expenses.
2. Administration expenses.
3. Claims against the estate to the extent incurred bona fide for a fair consideration in money or money's worth.
4. Unpaid mortgages upon or indebtedness in respect of property situated in the United States to the extent incurred or contracted bona fide and for a fair consideration in money or money's worth.
5. Losses incurred during the settlement of the estate arising from fire, storm, shipwreck or other casualty or from theft to the extent not compensated for by insurance or otherwise.
6. A reasonable amount for the support of dependents during the settlement of the estate; provided such amount is allowed by the laws of the jurisdiction under which the estate is being administered.
7. The value of any property which has been taxed by the federal government as a part of the gross estate of a decedent who died within 5 years of the decedent and the value of any property which has been taxed by the federal government under the gift tax law within 5 years of the death of the decedent.
8. The amount of all testamentary transfers and gratuitous transfers in contemplation of death (a) to or for the use of the United States, the states, territorites, political subdivisions thereof and the District of Columbia for exclusively public purposes; (b) to or for the use of corporations, trustees, etc., for exclusively religious, scientific, literary or educational purposes.
9. The specific exemption of $50,000.

Non-Residents.—No deductions are allowed in the case of a non-resident unless the return discloses the value of all of that part of the gross estate not situated in the United States. No specific exemption of $50,000 is allowed to non-residents. In the case of non-residents, that proportion of the items listed as numbers 1 to 6 above which the value of the gross estate situated within the United States bears to the value of the entire gross estate may be deducted from the value of the gross estate situated within the United States; but in no case shall the amount so deducted exceed 10% of the value of the gross estate situated in the United States.

The deduction for property taxed within 5 years, listed as item 7 above, is allowed in the case of non-residents, provided the property was situated within the United States at the time of the death of the prior decedent.

The deduction for public and charitable gifts listed above as item 8 is allowed to non-residents provided the gift is to be used for public or charitable purposes within the United States.

VALUATION OF PROPERTY.—Property included in the gross estate should be included at its fair market value at the time of the decedent's death. As nearly as possible the price at which the property would change hands between a willing buyer and a willing seller should be determined.

Credits

STATE INHERITANCE TAXES.—After the federal estate tax has been computed there should be deducted therefrom, as a credit, the amount of any estate, inheritance, legacy or succession taxes actually paid to any state or territory of the United States in respect to any property included in the gross estate. This credit will only be allowed to the extent of 25% of the federal estate tax.

GIFT TAX.—If a gift tax has been imposed upon a transfer made by the decedent and thereafter upon his death, the same property is required to be included in the gross estate for the purposes of the estate tax, the amount of such gift tax is to be credited against the estate tax.

Returns

PRELIMINARY NOTICE; RESIDENT ESTATES.—Within 2 months of the death of a resident decedent whose gross estate exceeded $50,000 in value, or within 2 months after the appointment of an executor or administrator of such an estate, the executor or administrator, or in the event no executor or administrator has been appointed, any person in possession of any property of the decedent, should notify the collector of internal revenue in whose district the decedent was domiciled at the time of his death, by filing form 704 in duplicate.

PRELIMINARY NOTICE; NON-RESIDENT ESTATES.—In like manner, in the case of non-resident decedents who owned any property situated in the United States, regardless of value, form 705 should be filed in duplicate in the office of the collector of internal revenue in whose district the property was located, or if located in more than one district, in the office of the Collector of Internal Revenue designated by the Commissioner of Internal Revenue.

THE TAX RETURN—WHEN REQUIRED.—Estate tax returns are required in the case of all non-resident decedents who owned any property situated within the United States. In the case of residents, returns are only required if the gross estate exceeds $50,000 in value.

Time of Filing.—Within one year of the decedent's death, a return on form 706 must be filed under oath, setting forth—(1) the value of the gross estate, or in the case of a non-resident, the value of the gross estate situated within the United States; (2) the deductions claimed (if deductions are claimed by a non-resident estate, the value of the gross estate wherever situated must be disclosed); (3) the value of the net estate; (4) the tax paid or payable thereon.

Extension of Time for Filing.—In case of sickness or absence, Collectors of Internal Revenue may extend the time for filing for a period not in excess of 30 days from the due date. The Commissioner of Internal Revenue, upon application showing good and sufficient cause, may extend the time for filing for not exceeding 6 months from the due date, no single extension to exceed 2 months.

By Whom Filed.—The return should be prepared and filed by the executor or administrator, or if there be more than one, by all of them jointly. If no executor or administrator has been appointed, any person in possession of any property of the decedent is required to prepare and file the return. If no return is filed or if a false or fraudulent return is filed, the Commissioner of Internal Revenue

or any collector or deputy collector of internal revenue may make and file the return.

Where Filed.—In the case of a resident decedent, the return should be filed in the office of the collector of internal revenue in whose district the decedent was domiciled at the time of his death. In the case of a non-resident decedent, the return should be filed in the office of the collector in whose district the decedent's property in the United States was situated, or if the property was situated in more than one district, in the office of the collector designated by the Commissioner of Internal Revenue.

Will to be Filed with Return.—If the decedent dies testate, two copies of the will, one of which must be certified, should be filed with the return.

Payment of Tax Disclosed by Return—Time of Payment.—The tax is payable 1 year from the date of the decedent's death.

Extension of Time for Payment of Tax Disclosed by Return.—The Commissioner may, where it is shown under oath that payment of the tax on the due date would impose an undue hardship upon the estate, extend the time for payment of the tax disclosed by the return for a period not to exceed 5 years. In such cases the Commissioner may require a penal bond as a condition to the granting of such extension.

Interest on Tax Disclosed by Return.—If the tax disclosed by the return, or any portion of it, is not paid on or before the due date and no extension of time for payment has been granted, such unpaid portion bears interest at the rate of 1% per month from due date until paid. If an extension of the time for payment has been granted, interest at the rate of 6% per annum from 18 months after the death of the decedent to the expiration of the extension is added to the tax even though the tax is paid prior to the expiration of the extension. In addition, if the time for payment has been extended and the tax is not paid prior to the expiration of the extension, interest at the rate of 1% per month from the date of the expiration of the extension to the date of payment is added.

Means of Payment.—The tax may be paid either by cash, check collectible at par or with bonds of the United States issued under the provisions of the First and Second Liberty Loan Acts, bearing interest at a rate higher than 4% per annum. If bonds are tendered in payment they will be accepted at their par value, but they must have been owned by the decedent continuously for at least 6 months prior to the date of his death.

Procedure after Return is Filed

INVESTIGATION OF RETURNS.—An investigation of every return, to verify its accuracy, is made by special officers of the Bureau of Internal Revenue. The reports of these officers are forwarded to the Estate Tax Division of the Miscellaneous Tax Unit of the Bureau of Internal Revenue in Washington. Here they are again examined and if it appears that a tax in excess of that properly due has been paid, the excess is refunded. If it appears that less tax has been paid than that properly due, the executor or administrator is notified of the deficiency by letter.

HEARINGS IN BUREAU OF INTERNAL REVENUE.—Within 30 days after the date of the letter notifying the estate of an alleged deficiency in tax, a protest may be filed and a hearing requested. At any time prior to 5 days before the date of the hearing the estate may present evidence in support of its

claim. If, at the hearing, the representatives of the estate and of the Estate Tax Division are unable to agree, an appeal may be taken to the Solicitor of Internal Revenue. Such an appeal to the Solicitor must be taken within twenty days after the estate is notified of the action of the Estate Tax Division.

APPEALS TO BOARD OF TAX APPEALS.—If, after the proceedings in the Bureau, the Estate Tax Division and the Solicitor still maintain that there is a deficiency in tax, the estate will be notified by registered mail. Within 60 days from the date of mailing of such notice the estate may appeal to the Board of Tax Appeals.

JEOPARDY ASSESSMENTS.—In any case where the Commissioner believes that the assessment or collection of tax will be jeopardized by delay, he may make an immediate assessment. In such case the executor may file a claim for abatement and if the claim is rejected, may appeal to the Board of Tax Appeals.

PERIOD WITHIN WHICH DEFICIENCY ASSESSMENT MAY BE MADE.—Except in the case of a false or fraudulent return, estate taxes must be assessed within 4 years after the return was filed. In the case of a false or fraudulent return assessment may be made at any time.

PAYMENT OF DEFICIENCY TAX.—If a deficiency in tax is established either by acquiescence therein by the estate, by failure of the estate to appeal to the Board of Tax Appeals or by a decision of the Board of Tax Appeals, the same is payable within 30 days from the date of notice and demand thereof.

EXTENSION OF TIME FOR PAYMENT OF DEFICIENCY TAX.—If the Commissioner finds that the payment of the deficiency in the tax upon the prescribed date would impose undue hardship upon the estate, he may, with the approval of the Secretary of the Treasury, extend the time for payment for not exceeding 2 years, in which case he may require a penal bond conditioned upon the payment of the tax.

INTEREST ON DEFICIENCY TAX.—In the case of a deficiency in tax, unless an extension of time for payment thereof has been granted and unless a claim for abatement thereof is filed, there is assessed as a part of the deficiency, interest at the rate of 6% per annum from the original due date (1 year from the decedent's death) to the date the deficiency is assessed. If the amount so assessed is not paid within 30 days from the date of notice and demand thereof, interest at the rate of 1% per month is added.

If an extension of time for the payment of the deficiency has been granted interest at the rate of 6% per annum for the period of the extension (even though the tax is paid prior to the expiration of the extension) is added. If the tax and interest are not paid at or prior to the expiration of the extension, interest at the rate of 1% per month from such expiration to the date of payment is added.

If a claim for abatement is filed and is disallowed by the Commissioner, or by the Board of Tax Appeals if an appeal has been filed, an amount equal to 6% per annum on the amount disallowed from the date of notice and demand following the jeopardy assessment and preceding disallowance to the date of the notice and demand following disallowance is added. If the tax and interest are not paid within 30 days of the date of the notice and demand following disallowance of the claim, interest at the rate of 1% per month from the date of such notice to the date of payment is added.

Claims

CLAIMS FOR REFUND.—A claim for the refund of any tax, interest or penalty alleged to be excessive or illegal may be filed within 4 years after payment.

CLAIMS FOR ABATEMENT.—If a jeopardy assessment has been made but not otherwise, a claim for abatement may be filed within 30 days from the notice and demand for the tax so assessed.

FORM OF CLAIM.—Both claims for refund and claims for abatement should be made on Form 843.

Penalties

KNOWINGLY MAKING FALSE NOTICE OR RETURN.—Anyone who knowingly makes any false statement in a notice or return is liable to a penalty of not exceeding $5,000 or to imprisonment for not exceeding one year or both.

In addition to the specific penalty above mentioned, 50% of the amount of the tax is added in the case of a false or fraudulent return with intent to evade tax.

FAILURE TO FILE NOTICE OR RETURN OR FURNISH EVIDENCE.—Anyone whose duty it is to file a notice or return and who fails to do so or who has in his possession or control any record, file or paper containing or supposed to contain information with reference to the estate or who has in his possession or control any part of the gross estate of the decedent and who fails to exhibit the same upon the request of the Commissioner of Internal Revenue or any collector or law officer of the United States is liable to a penalty of not exceeding $500 to be recovered with costs in a civil action in the name of the United States.

WILLFUL FAILURE TO MAKE RETURN, PAY TAX, KEEP RECORDS OR SUPPLY INFORMATION.—Any person required by law to pay a tax make a return, keep any records or supply any information and who willfully fails to do so, may, upon conviction, be fined not more than $10,000 or imprisoned for not more than one year or both.

WILLFUL ATTEMPT TO EVADE OR DEFEAT TAX.—A person convicted of a willful attempt to evade or defeat the tax may be fined not more than $10,000 or imprisoned for not more than 5 years or both. The same penalty is imposed on all persons who aid or advise in the preparation or presentation of a false or fraudulent return, affidavit, claim or document to be used in connection with any proceeding with reference to the tax.

FAILURE TO FILE RETURN ON DUE DATE.—If, without reasonable cause or as a result of willful neglect, a return is not filed at the time prescribed by law or within the time of any extension granted by the Commissioner of Internal Revenue, 25% of the amount of the tax is added. If the failure to file on time was due to a reasonable cause and was not due to willful neglect the 25% ad valorem penalty will not be imposed.

FEDERAL CAPITAL STOCK TAX

NATURE AND HISTORY OF TAX.—The federal capital stock tax is an excise tax on the privilege of doing business in a corporate capacity. The tax was first imposed in 1916 (Title IV of the Revenue Act of 1916) and became effective on January 1, 1917. It has been continued by succeeding revenue acts

CORPORATIONS REQUIRED TO FILE RETURNS.—Every corporation must file a return whether exempt or not (unless it has been notified officially that it is not liable for capital stock tax) and the determination of liability rests with the Commissioner. The term "corporation" includes associations and joint-stock companies, whether created by statute or by contract, but not partnerships, properly so called. It is immaterial whether or not the companies were organized for profit or have a capital stock represented by shares.

FORM TO BE USED.—Every **domestic corporation** shall make a return on Form 707. Every **foreign corporation** carrying on or doing business in the United States shall make return on Form 708, irrespective of the amount of capital employed in this country in the transaction of its business. The capital actually employed in the transaction of the business of a foreign corporation in the United States and the tax payable thereon shall be calculated in accordance with the instructions on the form.

CORPORATIONS EXEMPT FROM TAX.—The following classes of corporation are exempt from the tax:

1. The 13 classes of corporations not subject to the federal income tax (see Exempt Corporations hereinbefore).
2. Corporations "not doing business" (hereinafter illustrated).
3. Insurance companies (excepting mutual companies subject to the income tax imposed by section 230).
4. Corporations, the fair value of whose capital stock for the preceding year does not exceed $5,000.

"NOT DOING BUSINESS" ILLUSTRATED.—"Holding companies as distinguished from parent corporations, and corporations all of whose property and business is operated by, or is in the hands of, a receiver or the Alien Property Custodian, are not doing business.

"A **holding company** is defined as one whose corporate powers are limited to the mere owning and holding of property and distribution of its avails, or one which, although incorporated for the purpose of doing business, has substantially retired from the business for which it was organized and has reduced its activities to the mere ownership and holding of property, distributing its avails, and doing only such acts as are necessary to the maintenance of its corporate existence and the private management of its purely internal affairs.

"A holding company, as above defined, will not be considered to be doing business by reason of the reinvestment of its surplus income or funds to the extent only of maintaining its original investments." (Reg. 64 Rev., Art. 13.)

RETURN BY CORPORATION CLAIMING EXEMPTION.—"As corporations are generally organized to do business, every existing company is presumed to be subject to the tax unless satisfactory evidence is submitted showing that it is exempt. Organizations claiming exemption should fill out Form 707 but instead of computing the tax should enter in the space provided for the computation the notation 'Exemption claimed.' The determination of liability rests with the Commissioner of Internal Revenue and without complete information it is impossible to make a decision. Therefore in all such cases the return so filled out must be filed with the collector, together with a comprehensive statement of the reasons for claiming exemption except as provided hereinafter.

"When a corporation has once established to the satisfaction of the commissioner that it is an insurance company or a corporation entitled to exemption under section 231 of the law, and has been notified officially that it is not liable for capital stock tax, it need not thereafter file a return, unless it changes the

character of its organization or operations or the purpose for which it was created.

"Any change in status of an organization from that on which exemption was predicated, will make the organization affected liable for filing a complete return in July following the change, and failure to file will subject the corporation to the penalty provision of the law covering delinquent filing of returns.

"Collectors will keep a list of the exempt organizations to the end that they may occasionally inquire into the status and ascertain whether or not they are observing the conditions upon which exemption is predicated.

"Any corporation claiming exemption on the ground of not being engaged in business or on any ground other than those specified hereinbefore is not affected by the foregoing provisions and must file a capital stock tax return, as required by law, in July of each year. In such cases, however, if exemption has been allowed for the preceding taxable year and there has been no change in the status or conditions of the company then the first 13 numbered lines of Form 707 should be completed and a statement attached to the effect that exemption is claimed for the same reasons as for the previous year and that the same status and conditions of the company exist for the taxable period in question. In this way the records of the collectors' offices will be complete and corporations will avoid requests for the filing of returns and unnecessary correspondence." (Reg. 64 Rev., Art. 31.)

PERIOD COVERED BY RETURNS.—The period covered by the return is the fiscal year from July 1st of one year to June 30th of the following year.

"The tax being payable in advance does not apply to any corporation which was not engaged in business during any part of the fiscal year preceding the year for which the tax is due, but if it was in business even one day of the preceding year and one day of the taxable year it is subject to the tax. There is no relation between the amount of the tax payable and the length of time the corporation was in business. A corporation engaged in business during a part of the preceding year, but not engaged in business at the beginning of the taxable year, is not required to make any return if it is dissolved.

"If it is in process of dissolution, a return complete in all details should be filed, with supplemental statement showing that it has discontinued all business activities excepting such only as are necessary to effect the dissolution. If it is only temporarily inactive and subsequently during the year re-engages in business it should file a return in the month in which it recommences business and pay the tax due from the first of such month to the end of the taxable year. A corporation organized and beginning corporate activities on or after July 1 is not subject to tax for the remainder of the taxable period in which the company was organized, unless, as of July 1, it takes over the business of an organization which was subject to capital stock tax, in which event the new corporation is required to file a return and pay the tax. In the case of foreign corporations 'engaged in business' means the transaction of any business within the United States." (Reg. 64 Rev., Art. 28.)

COMPUTATION OF TAX.—On **domestic corporations,** the tax is imposed at the rate of $1 for each full $1,000 of the fair average value of the capital stock of the corporation in excess of the prescribed deduction of $5,000. The tax is measured by the fair average value for the year preceding the taxable year, not the fair value of the average capital stock. If a corporation begins business within the preceding year or increases or decreases its capital within the preceding year, thereby materially changing the fair value of the capital stock, the tax is measured by the fair value of the capital stock outstanding at the date

of incidence of the tax (June 30). Therefore, while form 707 permits as a matter of convenience to the taxpayer, the using of a balance sheet of a date prior to June 30, but not prior to the preceding December 31, if there is a material change in the condition and affairs of the company affecting the fair value of the capital stock subsequent to the closing of the books and prior to the date of the incidence of the tax (June 30), the financial condition should be reported under Exhibit A as of June 30, giving effect to such material changes. However, the tax is imposed on "the fair average value of the capital stock for the preceding year ending June 30," and a balance sheet of that date which shows a net worth materially different from the average of the year should obviously not be used as the sole basis for determining the value on which the tax is to be imposed. Where necessary to make clear the average value during the year, taxpayers should append such additional statements or data pertaining to Exhibit A as will aid the Commissioner in determining the fair average value.

METHODS OF ASCERTAINING FAIR VALUE.—"The fair average value of the capital stock for the purpose of determining the amount of the capital stock tax must not be confused with the market value of the shares of stock where it may be necessary to determine such value under other provisions of the revenue laws. The fair average value of the capital stock, the statutory measure of the tax, is not necessarily the book value or the value based on prices realized in current sales of shares of stock or the value determined by capitalization of earnings.

"Form 707 provides Exhibit A for the book or fair value of the assets, Exhibit B for the market value of the shares, and Exhibit C for the value of the capital stock based on the capitalized earnings. All information called for must be given in every case where it is procurable. The fair average value of the capital stock of a corporation and the tax payable thereon shall be determined from a consideration of the data contained in the return as well as all elements and factors affecting values, which should be harmonized so far as possible in the ultimate fair value found. Fair value is required irrespective of the exhibit used or the method employed in its determination." (Reg. 64 Rev., Art. 15.)

The official instructions in the forms for the year beginning July 1, 1925, for filling out these exhibits are set forth on page 4 of the return as follows:

EXHIBIT A: CONDENSED BALANCE SHEET.—Furnish under Exhibit A a condensed balance sheet as of June 30, 1925, if possible, but in no case earlier than December 31, 1924.

"*Date of Balance Sheet.*"—Exhibit A requires data as of June 30, 1925, if possible, but in no case earlier than December 31, 1924. A corporation whose fiscal year ends between June 30 and December 31, 1924, and which finds it impossible to prepare a statement from the books as of June 30, 1925, may report in the "Books of account" column values as of the close of their last fiscal year preceding December 31, 1924, and will in every instance make use of the "Fair value" column to estimate values as of June 30 immediately preceding the taxable period. Capital stock will be shown in the "Fair value" column as a capital liability in the amount actually outstanding on June 30, 1925. This amount will agree with items 8, 9, and 10 on page 1 of the return, and no substitution of dates is permitted in either case. Where the books are closed in July or August, tentative return may be filed and completed return immediately after closing of books.

Banks should submit balance sheets as of June 30, 1925, in all cases. Published statements are acceptable unless reconstruction is necessary to reflect actual value.

"*Books of account.*"—These columns must show the amounts as carried in the taxpayer's books of account.

"*Fair value.*"—Refer to article 1 above defining the value required, and in the event that the columns "Books of account" contain any overstated or understated values show herein the actual values. If any different valuation is claimed than reported in the "Fair value" column it may be stated and should be supported by reasonably conclusive evidence.

"*Difference.*"—These columns will show the difference between the columns "Books

of account" and "Fair value." Any material differences *must be explained* in such manner as to enable the Commissioner of Internal Revenue to determine if they are proper and acceptable. For this purpose the differences shown herein need not be covered by corresponding adjustments in the taxpayer's books of account.

"*Profit and loss.*"—If the "Profit and loss" balance is a debit, the amount should be shown in red.

Reserves for the payment of future dividends, whether declared or not, will not be considered as liabilities, but a reasonable amount to cover the preceding dividend period may be so considered if the dividend has been declared and not disbursed. If deducted, show date declared and date of actual payment.

EXHIBIT B: QUOTATIONS OR OUTSIDE SALES PRICES.—Furnish under Exhibit B the prices quoted on a recognized stock exchange or on the New York curb, or the prices at which outside sales were made if the stock is not listed, for the period of 12 months ending June 30, 1925.

If the stock is listed, the name of the exchange from which reported quotations are taken must be shown in the space provided therefor, and the prices reported will be the mean of the highest and of the lowest bid price during each month, from which the average for the year will be obtained. If the taxpayer prefers, a schedule may be attached to this return showing the highest and lowest bid price at which stock was quoted for each day of the year and the average obtained therefrom.

If the stock is not listed and outside sales have been made at prices known or determinable by the officers making this report, such prices will be reported herein. A statement of the number of shares involved and the conditions under which sales were made at other than exchange quotations must accompany this return. Sales to employees or directors for qualifying purposes, or sales which are restricted as to resale, or sales at prices otherwise specially influenced, will not be considered representative of the fair value of the entire capital stock and should not be included.

In the column "Number of shares outstanding" should be shown the total number of shares outstanding at the close of each month. The average value per share will be determined as follows:

First. If no change occurred in the number of shares outstanding during the year, total the quotations or sales prices for the months reported and divide by the number of months in which quotations or sales prices are shown.

Second. If any change occurred in the number of shares outstanding during the year, multiply the average market price per share for the period during which the capital stock as of June 30, 1925, has been outstanding by the number of shares outstanding as of that date.

EXHIBIT C: ANNUAL INCOME.—Furnish under Exhibit C the annual income and other data for the five fiscal years ended with the close of the taxpayer's fiscal year or for the period during which the corporation has been engaged in business if for a shorter period.

"*Net income.*"—In this column will be shown the income returned for the purpose of the income tax and excess-profits tax.

"*Deductions*" *and* "*Additions.*"—Refer to article 1 of these Special Instructions and show in these columns such amounts as should be deducted from or added to "Net income" to arrive at the adjusted income which may be capitalized to determine the fair value of the capital stock. A comprehensive analysis of any amounts reported therein should be attached to this return. Some of the principal items frequently requiring adjustments are—

Deductions:

Income and profits taxes not deductible in computing income subject to tax.
Interest charges not deductible in computing income subject to tax.
Losses not fully deductible in computing income subject to tax.

Additions:

Dividends from other corporations not included in computing income subject to tax.
Income from securities of a State, municipality, or of the United States, not included in the income tax return.
The difference between depletion allowed in determining net income subject to Federal income tax and the actual depletion based on cost.

Expenditures made for additions and betterments, or reserves for such purposes, charged against income, whether direct or through expense.

"*Adjusted income.*"—This column will reflect the amounts resulting from the adjustment of the amounts shown in the three preceding columns.

"*Number of shares.*"—Herein should be given the total number of shares of all classes of stock outstanding at the close of each fiscal year.

"*Dividends declared.*"—Herein should be reported the percentage of dividends declared on each class of stock outstanding each year. The amount represented by the percentages shown in this column must not be deducted from the columns "Net income" or "Adjusted income."

"*Depreciation.*"—Hereunder will be reported the amount actually charged against income each year in the taxpayer's books of account for depreciation.

Capitalizing net income.—The officers making the return will capitalize the average annual income on a percentage basis that fairly represents, under the conditions obtaining in the trade in the locality, what representative enterprises must earn in order to maintain their stock at par. In other words, if enterprises engaged in a similar business must on the average earn 12 per cent on their issued capital stock to keep the value of their stock at par, the net income should be capitalized by dividing it by .12.

WHEN RETURNS SHALL BE FILED.—It shall be the duty of every corporation on or before the 31st day of July in each year to make a return to the collector of the district in which its principal place of business is located. If any corporation fails to make and file a return within the time prescribed by law or by regulation made under authority of law, or makes, willfully or otherwise, a false or fraudulent return, the collector or deputy collector shall make the return from his own knowledge and from such information as he can obtain through testimony, or otherwise. The Commissioner of Internal Revenue, from similar sources of information, may make a return or amend any return made by a collector or deputy collector. Any return so made and subscribed by the commissioner, or by a collector or deputy collector and approved by the commissioner, shall be prima facie good and sufficient for all legal purposes.

EXTENSION OF TIME.—If on account of sickness or absence of the officer of the corporation charged with making the return, it is impossible to prepare and file a return on or before the 31st day of July, the collector, upon application in writing, may allow an extension of time not exceeding 30 days from July 31st, in which to file the return. If extension is granted, the letter of the collector should be attached to the return. On no account is the Commissioner of Internal Revenue or the collector authorized to grant an extension of time in which to file capital stock tax returns in excess of 30 days from July 31.

TENTATIVE RETURN.—If for reasons, other than absence or sickness, beyond the control of the officers making the return, it becomes impossible to file a completed return within the time prescribed by law, a tentative return may be filed. The filing of a tentative return within the prescribed period will avoid the penalty for delinquent filing, but will not authorize the withholding of the tax. The regulations do not permit the filing of a tentative return to stay indefinitely the filing of a completed return and the collection of the tax due. Therefore, if a tentative return is filed it should be clearly marked "Tentative Return" and should be prepared in as complete a manner as possible, including, among other information, a basis for the computation of the tax, that is, an estimate by the officers of the corporation of the approximate fair value of the capital stock in order that an initial assessment may be made. When the completed return is filed, it should be clearly marked "Completed Return," showing that a tentative return was filed. Such action will prevent duplicate assessments and ordinary penalties. In every case a statement should be attached to the tentative return, indicating the approximate date

the completed return may be expected. Upon receipt of the completed return any adjustment necessary in the assessment of the correct tax due will be made. Taxpayers who have paid the tax on the basis of a tentative return and subsequently the completed return shows less tax, should file a claim for refund of the excess with the completed return.

SIGNATURES AND VERIFICATION.—Returns must be signed and verified by the president and the treasurer of the corporation, and must be sworn to before an officer authorized to administer oaths, and the seal of the attesting officer, if he is required to have a seal, must be impressed on the return. In the absence of the president or treasurer, other responsible officers may sign the return. The name of the corporation and the names of the officers signing the return should be plainly written or printed on the return. If, however, the tax covered by the return does not exceed $10, the return may be signed or acknowledged before two witnesses instead of under oath.

RETURNS OF AFFILIATED CORPORATIONS.—Although consolidated returns for affiliated corporations are permitted for the purpose of income tax, for the purpose of capital stock tax each corporation must render a separate return in complete form. So-called subsidiary corporations, all or a part of the stock of which is owned by another corporation, must render separate returns. No deductions from the assets are permitted on account of intercompany balances, and the shareholdings must be reported in the "Fair Value" column at their actual worth at the time of making the return. No deduction is allowed in the return of one corporation for the tax paid by another. The parent company should submit with its return a list of all subsidiaries and the districts in which they are required to file returns; the number of shares of stock held in each subsidiary and the value at which carried on the books. If any agreement affecting independent operation exists between parent company and subsidiary, a copy thereof must be furnished, or a statement made that none exists.

A combined balance sheet and a combined net income statement may be submitted for consideration in connection with any estimate of fair value made on behalf of the reporting corporation.

In order to facilitate audit, parent companies should attach to the return a supplemental Exhibit C, showing consolidated income of the group.

TIME OF PAYMENT OF TAX.—The collector may accept payment of the tax when the return is filed as an "advance collection," subject to any adjustment later found necessary, but no corporation is required to pay the tax until after notice and demand. Tax due from a corporation which has liquidated is collectible by suit from the stockholders or others who have received its assets.

PENALTIES.—Any corporation which fails to pay the tax when due and payable is liable to a penalty of 5% and interest at 1% per month. If it willfully refuses to pay or willfully attempts to evade the tax, it is liable also to a fine of $10,000 and costs. Any officer or employee of a corporation who in the course of his duty fails to pay tax when due and payable, or if he willfully refuses to pay or willfully attempts to evade the tax, is liable to a fine of $10,000 and costs and to imprisonment for a year, and to a penalty of the amount of the tax unpaid or evaded.

A taxpayer who files a tardy return and wishes to avoid the penalty must make an affirmative showing of all the facts alleged as a reasonable cause for failure to file the return on time in the form of an affidavit, which should be attached to the return. If such an affidavit is furnished with the return or

upon the collector's demand the collector, unless otherwise directed by the Commissioner, will forward the affidavit with the return, and if the Commissioner determines that the delinquency was due to a reasonable cause and not to a willful neglect the penalty will not be assessed. If the taxpayer exercised ordinary business care and prudence and was nevertheless unable to file the return in the prescribed time, then the delay is due to "reasonable cause."

CLAIMS FOR ABATEMENT AND REFUND.—The Commissioner of Internal Revenue will follow the same general procedure in the treatment of fraudulent lists, statements or returns and the collection, abatement, and refund of capital stock taxes, as in the case of other internal revenue taxes.

Claims for credit are not permissible as will be noted from the following:

"Section 238 of the Revenue Act of 1924 provides for a credit against additional income taxes due to previous overpayments of income or excess-profits taxes. The law does not authorize the credit of an excess payment of capital stock tax for a given period against an assessment of the same or other tax for a previous or subsequent period. A claim for abatement or refund for the excess assessment should be filed and payment made of the correct tax due for the previous or subsequent period." (Reg. 64 Rev., Art. 32.)

TIME LIMITS FOR ADDITIONAL ASSESSMENTS AND REFUNDS.—Section 1009 of the 1924 law provides that, notwithstanding the provisions of section 3182 of the Revised Statutes, assessments of additional taxes must be made within four years after such taxes become due. In the case of fraud with intent to evade tax or willful attempt in any manner to defeat or evade tax, such tax may be assessed at any time. Section 1012 of the 1924 law, amending section 3228 of the Revised Statutes, provides that claims for refund of taxes erroneously or illegally assessed or collected must be filed within four years next after payment of such tax.

EXCISE TAXES

Excise taxes, imposed under Title VI of the Revenue Act of 1924, became effective on July 2, 1924, and supersede the taxes imposed by Title IX of the Revenue Act of 1921, which was repealed as of July 2, 1924. The following articles (listed alphabetically) sold or leased by the manufacturer, producer, or importer, are subject to tax in the following percentages, which are based upon the sale or lease prices:

	Tax
Automatic Slot-Device Machines: Coin-operated devices, coin-operated machines, and devices operated by any substitute for a coin	5%
If operated for profit by the manufacturer, producer or importer, the tax shall be based on the fair market value of each machine at the same rate as shown above.	
Automobile truck chassis and automobile wagon chassis, on the selling price in excess of $1,000 and on automobile truck bodies and automobile wagon bodies on the selling price in excess of $200 (including tires, inner tubes, parts and accessories, sold on or in connection therewith)	3%
Automobiles and motor cycles, other than above (including tires, inner tubes, parts and accessories, sold on or in connection therewith) except tractors	5%
A sale or lease of an automobile is considered to be a sale of the chassis and of the body.	

	Tax
Cameras, weighing not more than 100 lbs., and lenses therefor	10%
Cigars or cigarette holders and pipes, composed wholly or in part of meerschaum or amber	10%
Films and plates (photographic) except moving picture films and X-Ray films or plates	5%
Firearms, shells and cartridges, except those sold for use by the United States, any State, Territory or possession of the United States, any political subdivision thereof, or the District of Columbia	10%
Humidors	10%
Jewelry: Real or imitation; pearls, precious and semi-precious stones and imitations thereof; articles made of or ornamented, mounted or fitted with precious metals or imitations thereof, or ivory, watches, clocks, opera glasses, lorgnettes, marine glasses, field glasses and binoculars, sold by or for a dealer or his estate for consumption or use on selling price This tax **does not apply** to (1) surgical instruments, musical instruments, eyeglasses, spectacles or silver-plated flat tableware, or articles used for religious purposes; (2) articles sold or leased for an amount not in excess of $30, or (3) watches sold or leased for an amount not in excess of $60.	5%
Mah-jongg, pung chow and similar tile sets, and component parts thereof	10%
Statuary, sculpture, paintings, art porcelain, and bronzes sold by persons other than the artist (except when sold to any educational institution or public art museum, or by a dealer in such articles to another such dealer for resale)	5%
Tires, inner tubes, parts or accessories, for any articles listed under the headings "Automobile Trucks, etc.," and "Automobiles and Motorcycles, etc.," sold to a person other than a manufacturer or producer of any of the articles there mentioned	2½%

If any manufacturer, producer, or importer of any of the above articles customarily sells such articles both at wholesale and at retail, the tax in the case of any article sold by him at retail shall be computed on the price for which like articles are sold by him at wholesale.

SALE AT LESS THAN FAIR MARKET PRICE.—If any person who manufactures, produces or imports any article mentioned above, sells or leases such article to a corporation affiliated with such person within the meaning of section 240 of the 1924 law at less than the fair market price obtainable therefor, the tax thereon must be computed on the basis of the price at which such article is sold, or leased by such affiliated corporation; and if any such person sells or leases such article whether through any agreement, arrangement, or understanding, or otherwise, at less than the fair market price obtainable therefor, either (1) in such manner as directly or indirectly to benefit such person or any person directly or indirectly interested in the business of such person, or (2) with intent to cause such benefit, the amount for which such article is sold or leased must be taken to be the amount which would have been received from the sale or lease of such article if sold or leased at the fair market price.

RETURNS.—Every person subject to the tax must make monthly or quarterly returns in duplicate, under oath, and pay the taxes to the collector for the district in which the principal place of business is located, in accordance with

the regulations of the Commissioner. The tax is due at the time for filing the return. If the tax is not paid when due, there will be added as part of the tax interest at the rate of 1% for each full month, from the time when the tax became due.

TAX ON CIGARS, CIGARETTES AND TOBACCO.—Title IV of the Revenue Act of 1924 imposes the following taxes which are effective June 2, 1924, and are in lieu of those imposed by Title VII of the Revenue Act of 1921 repealed as of the above date:

	Tax
Cigars: Manufactured in or imported into the United States and sold or removed for consumption or sale:	
Weighing not more than 3 lbs. per 1,000; per 1,000	$ 1.50
Weighing more than 3 lbs. per 1,000 if manufactured or imported to retail at:	
Not more than $.05 each, per 1,000	4.00
More than $.05 and not more than $.08 each, per 1,000	6.00
More than $.08 and not more than $.15 each, per 1,000	9.00
More than $.15 and not more than $.20 each, per 1,000	12.00
More than $.20 each, per 1,000	15.00
Cigarettes: Manufactured in or imported into the United States and sold or removed for consumption or sale:	
Weighing not more than 3 lbs. per 1,000; per 1,000	$ 3.00
Weighing more than 3 lbs. per 1,000; per 1,000	7.20
The law prescribes the manner and size of packages in which cigars, cigarettes and tobacco should be packed. Manufacturers affix and cancel stamps denoting payment of the tax.	
Tobacco and Snuff: Manufactured in or imported into the United States and sold or removed for consumption or sale, per lb.	$ .18
Cigarette Papers and Tubes: Made up in or imported into the United States and sold to any person other than a manufacturer for the purpose of manufacture.	
Papers, for each package, book or set containing:	
Over 25 and not over 50 papers	$ .005
Over 50 and not over 100 papers	.01
Over 100, for each 50 papers or fraction thereof	.005
Tubes, for each 50 tubes or fraction thereof	.01
Cigarette manufacturers purchasing papers made up into tubes must give bond that they will use such tubes in the manufacture of cigarettes, or pay the tax imposed, as shown above. They must keep such records and render such returns as the Commissioner may prescribe in order to show the disposition of such tubes.	

PENALTY.—Every dealer in leaf tobacco:

(a) Who neglects or refuses to furnish the statement, to give bond, to keep books, to file inventory or to render the invoices, returns or reports required by the Commissioner, or to notify the collector of the district of additions to his places of storage; or

(b) Who ships or delivers leaf tobacco contrary to the regulations prescribed by the Commissioner; or

(c) Who fraudulently omits to account for tobacco purchased, received, sold, or shipped;

Shall be fined not less than $100 or more than $500, or imprisoned not more than 1 year or both.

A farmer or grower of tobacco or a tobacco growers' cooperative association is not regarded as a dealer in leaf tobacco in respect to the leaf tobacco produced by him or handled by such association. Such cooperative associations are required to keep records of all purchases and sales of tobacco, such records to be open to inspection by the agents of the government. The term "tobacco growers' cooperative association" is defined to mean an association of farmers or growers of tobacco organized and operated as sales agent for the purpose of marketing the tobacco produced by its members and turning back to them the proceeds of sales, less the necessary selling expenses, on the basis of quantity and quality of tobacco furnished by them.

SPECIAL TAXES

Title VII of the 1924 law imposes the following taxes which became effective July 1, 1924, unless otherwise stated, and are in lieu of the taxes imposed under Title X of the Revenue Act of 1921 which has been repealed:

	Tax
Automobiles, Passenger: Persons operating or renting passenger automobiles for hire—	
On each machine with seating capacity of over 2 and not over 7	$ 10.00
Over 7	20.00
Boats (See Yachts)	
Bowling Alleys and Billiard Rooms: To be paid by proprietor on each alley or table annually	10.00
Every building or place where bowls are thrown or where games of billiards or pool are played, except in private homes, shall be regarded as a bowling alley or a billiard room respectively.	
Brewers, Distillers, Wholesale and Retail Liquor Dealers, Wholesale and Retail Dealers in Malt Liquors, and Manufacturers of Stills, as defined in section 3244, as amended, and section 3247 of the Revised Statutes, carrying on such business in a state, territory, or district of the United States contrary to laws of such state, territory or district, or in any place therein in which the carrying on of such business is prohibited by local or municipal law, in addition to all other taxes, special or otherwise	1,000.00
Brokers:	
Custom House brokers, per annum	50.00
Pawn brokers, per annum	100.00
Ship brokers, per annum	50.00
Stockbrokers and Produce brokers, defined as persons engaged in business of purchasing or selling stocks, bonds, exchange, bullion, coined money, bank notes, promissory notes, other securities, produce or merchandise for others, per annum	50.00
Brokers who are members of a stock exchange, produce exchange, board of trade, or similar organization where produce or merchandise is sold, in addition, must pay, per annum:	
If the average value during preceding year ending June 30 of a seat or membership in such exchange or organization was $2.000 or over, but not over $5,000	100.00

	Tax
If such value was over $5,000 but not over $10,000	$150.00
If such value was over $10,000	250.00

Capital Stock Tax (See Federal Capital Stock Tax)

Cigar, Cigarette and Tobacco Manufacturers, per annum:

Cigars:	
Where annual sales do not exceed 50,000 cigars	4.00
Where annual sales exceed 50,000 and do not exceed 100,000 cigars	6.00
Where annual sales exceed 100,000 and do not exceed 200,000 cigars	12.00
Where annual sales exceed 200,000 and do not exceed 400,000 cigars	24.00
Where annual sales exceed 400,000 cigars	24.00
On excess over 400,000 cigars, in addition, per 1,000 cigars or fraction	.10
Cigarettes:	
On manufacturers of cigarettes, including small cigars, weighing not over 3 lbs. per 1,000; per 10,000 cigarettes or fraction thereof	.06
Tobacco:	
Where annual sales do not exceed 50,000 lbs	6.00
Where annual sales exceed 50,000 lbs. and do not exceed 100,000 lbs	12.00
Where annual sales exceed 100,000 lbs. and do not exceed 200,000 lbs	24.00
Where annual sales exceed 200,000 lbs	24.00
On excess over 200,000 lbs. in addition, per 1,000 lbs. or fraction	.16

In arriving at the amount of special tax to be paid, each person engaged in the manufacture of more than one of the classes of articles specified above is considered and deemed a manufacturer of each class separately. In computing the amount of annual sales no account is taken of tobacco, cigars, or cigarettes sold for export and in due course so exported.

Liquor Distillers (See Brewers)

Motor Boats (See Yachts)

Opium and Derivatives:

Importers, manufacturers, producers or compounders, per annum	24.00
Physicians, dentists, veterinary surgeons, and other practitioners lawfully entitled to distribute or administer any of the products listed in the course of their professional practice, per annum	3.00
Retail dealers, per annum	6.00
Wholesale dealers, per annum	12.00
On opium, coca leaves, any compound, salt, derivatives, or preparation thereof, produced in or imported into the United States and sold or removed for consumption or sale, per ounce or fraction	.01

Every person, on or before July 1st of each year, who imports, manufactures, produces, compounds, sells, deals in, dispenses, or gives away opium or coca leaves, or any compound, manu-

Tax

facture, salt, derivative, or preparation thereof, must register, with the collector of internal revenue of the district, his name or style, place of business and pay the tax. Persons at the time of engaging in any of such activities must immediately make like registration and pay the proportionate part of the tax for the period ending on the following June 30. This tax is imposed in addition to any import duty imposed on the aforesaid drugs.

Passenger Automobiles (See Automobiles)

Riding Academies: To be paid by proprietors, per annum..... $100.00

Every building, space, tent, or area, where a charge is made for instruction in horsemanship or for facilities for the practice of horsemanship is regarded as a riding academy. The tax is not collected from associations composed exclusively of members of units of the Federalized National Guard or the Organized Reserve and whose receipts are used exclusively for the benefit of such units.

Shooting Galleries: To be paid by proprietors, per annum..... 20.00

"Shooting Galleries" include every building, space, tent or area where a charge is made for the discharge of firearms, at any form of target.

Tobacco (See Cigars, etc.)

Yachts, Motor Boats, etc.: On the use of yachts, pleasure boats, power boats, sailing boats and motor boats with fixed engines, of over 5 net tons and over 32 feet in length, not used exclusively for trade, fishing or national defense or not built according to plans and specifications approved by the Navy Department, per annum:

Length over 32 feet and not more than 50 feet, per foot..... 1.00
Length over 50 feet and not over 100 feet, per foot..... 2.00
Length over 100 feet, per foot..... 4.00

The tax is due on July 1st of each year and also at the time of purchase of a new boat by a user on date other than July 1. In case of the original purchase of a new boat on a date other than July 1, the amount payable is the same number of twelfths of the amount of tax as number of calendar months (including month of sale) remaining prior to the following July 1. In determining length, measurements of over-all length shall govern. No tax is paid on vessels or boats used without profit by benevolent, charitable, or religious organizations, exclusively for furnishing aid, comfort, or relief to seamen.

TAX ON ADMISSIONS AND DUES

This tax is imposed under Title V of the Revenue Act of 1924, effective July 2, 1924, and supersedes the tax imposed by the Revenue Act of 1921.

Admissions

Tax

Admissions: Persons paying admissions (except where admission price is $.50 or less when no tax is due) per each $.10 or fraction thereof..... $.01

	Tax
An additional tax is levied on the amount paid for tickets to places of amusement, sold in excess of the regular price at places other than ticket offices of such amusements as follows:	
On the excess, if such excess is not over $.50	5%
On the excess, if such excess is over $.50	50%
Sold by proprietors or employees of such amusements for an amount in excess of regular price, on the excess	50%
Boxes or Seats: For permanent use, on the amount for which a similar box or seat is sold for each performance at which the box or seat is used or reserved	10%
Cabarets: Or similar entertainments to which the charge for admission is wholly or in part included in the price paid for refreshment, service, or merchandise; per each $.10 or fraction thereof	$.015
The amount paid for such admission is deemed to be 20% of amount paid for refreshment, service, and merchandise. Where the amount paid for admission is $.50 or less, no tax is imposed.	

ADMISSIONS EXEMPT FROM TAX.—No tax is levied on (1) any admissions, the proceeds of which, inure (a) exclusively to the benefit of religious, educational, or charitable institutions, societies, or organizations, societies for the prevention of cruelty to children or animals, or societies or organizations conducted for the sole purpose of maintaining symphony orchestra and receiving substantial support from voluntary contributions, or of improving any city, town, village, or other municipality, or of maintaining a cooperative or community center moving-picture theater, providing no part of the net earnings thereof inures to the benefit of any private stockholder or individual; or (b) exclusively to the benefit of persons in the military or naval forces of the United States; or (c) exclusively to the benefit of persons who have served in such forces and are in need; or (d) exclusively to the benefit of National Guard organizations, reserve officers' associations or organizations, posts or organizations of war veterans, or auxiliary units or societies of any such posts or organizations, if such posts, organizations, units or societies are organized in the United States or any of its possessions, and if no part of their net earnings inures to the benefit of any private stockholder or individual; or (e) exclusively to the benefit of members of the police or fire departments of any city, town, village, or other municipality, or dependents or heirs of such members; or (2) any admissions to agricultural fairs if no part of the net earnings thereof inures to the benefit of any stockholders or members of the association conducting the same, or admissions to any exhibit, entertainment, or other pay feature conducted by such association as part of any such fair, providing the proceeds therefrom are used exclusively for the improvement, maintenance and operation of such agricultural fairs.

Dues

	Tax
Dues or Membership Fees: In social, athletic, or sporting clubs, where the active resident annual dues are over $10 on amount thereof	10%
Assessments (excluding those for capital expenditures) are subject to the tax.	

INITIATION FEES.—Any amount paid as initiation fees to a social, athletic, or sporting club is subject to a 10% tax, if (1) such fees amount to

more than $10, or (2) the dues of an active resident member are in excess of $10 per year. The term "initiation fee" as defined by Article 10 of Regulations 43, Part II, issued under the Revenue Act of 1924, includes any payment to the club as a condition for membership, whether evidenced by a certificate of membership or a share of stock in the club or not. Thus, it includes amounts paid to such clubs or organizations for stock where the purchase of such stock is required as a prerequisite of membership. This applies only to stock purchased from the club or organization and not to amounts paid for stock purchased from retiring members, or other sources, or for purchases in excess of the requirement for membership.

If the land of a club is owned by a corporation organized for that purpose, and the purchase of stock in this corporation is required as a prerequisite to membership, the money paid for this stock is not taxable as an initiation fee.

Amounts paid for the purchase of a first mortgage bond secured by the club's property, though required as a prerequisite to membership, is not taxable as an initiation fee. The reason for this difference is that a share of stock represents an undivided interest in the corporation, while such a bond is an evidence of indebtedness.

The amount which is required to be deposited in a certain fund, known as a deposit fund, by each prospective member of the club, in order to gain membership therein, is taxable as an initiation fee.

LIFE MEMBERSHIPS.—Members are taxed annually at the same time and for a like amount as active resident annual members.

DUES EXEMPT FROM TAX.—Dues to a fraternal society, order, or association operating under the lodge system, are exempt from tax.

COLLECTION AND PAYMENT OF TAXES.—All persons receiving dues or fees and clubs and organizations having life members shall collect the taxes imposed, make monthly reports, and pay the taxes so collected to the collector in the district where such person, club or organization is located.

PENALTY.—If the tax is not paid when due, there shall be added as a part of the tax, interest at the rate of 1% a month from the time when the tax became due until paid.

STAMP TAXES

The present stamp taxes are imposed under Title VIII of the Revenue Act of 1924 which went into effect on July 2, 1924. This title is practically a reenactment of Title XI of the Revenue Act of 1921—

GENERAL EXEMPTIONS.—The following instruments are not subject to the stamp tax:

1. Bonds, notes, or other instruments issued by the United States or by any foreign government, or by any state, territory or the District of Columbia, or local subdivision thereof, or municipal or other corporation exercising the taxing power.
2. Bonds of indemnity required to be filed by any person to secure payment of any pension, allowance, allotment, relief, or insurance by the United States, or to secure a duplicate for, or the payment of, any bond, note, certificate of indebtedness, war-savings certificate, warrant or check, issued by the United States.
3. Stocks and bonds issued by co-operative building and loan associations which are organized and operated exclusively for the benefit of their

members and make loans only to their shareholders, or by mutual ditch or irrigation companies.

WHERE STAMPS MAY BE PROCURED.—Stamps are sold by collectors, deputy collectors of internal revenue and postmasters, and are also on sale at United States depositaries. Ordinary postage stamps cannot be used for the payment of any internal revenue taxes.

WHERE STAMPS ARE AFFIXED.—As a general rule, stamps are affixed to the document or instrument itself, but in some cases this rule does not prevail, as will be hereinafter illustrated.

WHO AFFIXES STAMPS.—The law contemplates that stamps shall be affixed by the person issuing the document or instrument but there is no inhibition against a person accepting or receiving any such document or instrument to affix the stamp if he is willing or has agreed to do so. It has been held that it makes no difference who affixes the stamp, as long as a stamp of the proper denomination is affixed to the instrument. Both parties to a taxable instrument are responsible to the Government for affixing and cancelling stamps in the required amount.

CANCELLATION OF STAMPS.—Stamps are cancelled by the person using or affixing the stamp, by writing or stamping thereon or causing to be written or stamped thereon in ink, his initials and the day, month, and year on which the stamp is used or affixed, or by cutting and cancelling the stamp with a machine or punch which will affix the initials and date as aforesaid and so deface the stamp as to render it unfit for reuse. In addition, stamps of the value of 50 cents or more are required to be cancelled by three parallel incisions made by some sharp instrument lengthwise through the stamp after the stamp has been attached to the instrument, except that this is not required where stamps are cancelled by perforation. The cancellation by either method should not so deface the stamp as to prevent its denomination and genuineness from being readily determined. The perforating machine may also imprint the initials and date or outline the same in small perforations, thus insuring complete cancellation, or the initials and date may be written on the stamp, and several perforations, sufficient to prevent washing and resale of the stamp may be made with an ordinary hand punch before fixing the stamp to the document. Where the initials of a person, firm or corporation have been perforated on the stamps before being used it is sufficient when the stamps are actually attached to the instrument to stamp the same with the full initials and date. Where the initials of a firm or company have been stamped or written on a stamp it is not required that the individual employee affixing the stamp shall also place his own initials thereon. It has been held that stamps on promissory notes were properly cancelled when they were so used and defaced that they could never be legally used again. In a suit upon a promissory note it was held that the failure to write the payee's initials on the stamp, when he was affixing the stamp and cancelling the same in the presence of the court before offering the note in evidence did not affect its sufficiency. A stamp affixed to an instrument and cancelled can not lawfully be removed and affixed to another instrument requiring a stamp. Amounts paid for stamps used in excess, or on instruments not actually effective and for which a substitute is prepared and stamped, or on instruments not subject to tax, may be refunded, upon claim properly presented to the collector.

The following documents and instruments, which are listed in alphabetical order, are subject to the stamp tax:

	Tax
Bonds, Debentures, or Certificates of Indebtedness issued by any person and all corporate securities issued with interest coupons or in registered form, on each $100 of face value or fraction thereof	$.05

The required stamps may be affixed either to the bonds or to the indenture under which the bonds were issued. If the stamps are affixed to the indenture, a statement to that effect must be made on the bonds.

Renewals are taxed as new issues and when a bond is conditioned for repayment of money in a penal sum greater than the debt secured, the tax shall be on the amount secured.

No tax is imposed upon the transfer of bonds, debentures or certificates of indebtedness from one holder to another.

Capital Stock, Original Issue:	
With par value, each $100 face value or fraction thereof	$.05
Without par value, actual value less than $100 per share, each $20 of actual value or fraction thereof	.01
Without par value, actual value $100 per share, each share	.05
Without par value, actual value over $100 per share, each $100 or fraction thereof	.05

The stamps are required by law to be attached to the stock books and not to the certificates.

Capital Stock and Rights to Subscribe, Sales and Transfers:	
With par value, each $100 face value or fraction thereof	$.02
Without par value, each share	.02

The stamps shall be affixed to (a) transfer books where shown only on books; (b) certificate where transfer is by certificate; (c) bill of sale where certificate is delivered in blank.

Certificates of Indebtedness (See Bonds, etc.)

Conveyances of Real Estate, by deed, instrument, or writing (not to secure debt) on consideration, less liens or encumbrances remaining thereon at time of sale:	
Exceeding $100, not in excess of $500	$.50
Each additional $500 or fraction thereof	.50

Debentures (See Bonds, etc.)

Deeds (See Conveyances)

Entry of Merchandise at Custom House—on value of merchandise:	
Not exceeding $100	$.25
Exceeding $100 and not exceeding $500	.50
Exceeding $500	1.00
Entry for withdrawal of merchandise from customs bonded warehouse	$ .50

Memorandum of Sale (See Produce)

Passage Ticket, one way or round trip transportation by vessels from U. S. to destination not in the U. S., Canada or Mexico:	
Not exceeding $30	$1.00
Exceeding $30 and not exceeding $60	3.00
Exceeding $60	5.00

No tax is imposed on tickets costing $10 or less.

Playing Cards, pack containing not over 54 cards..... $ .10

Policies of Insurance, Certificates, Binders or other instruments (except policies of reinsurance), charged on each dollar of premium or fraction thereof..... $ .03

The above applies to insurance made or renewed upon property within the United States, against peril by sea, or on land and inland waters or by fire, lightning, tornado, bombardment, etc., issued to a domestic corporation, partnership or individual resident of the United States by a foreign corporation, partnership or individual not a resident of the United States, when such policy or instrument is not signed or countersigned by an agent of the insurer within any State, Territory or district of the United States within which insurer is authorized to do business.

Power of Attorney, except for use in Government pensions or claims, back pay, bounty, or for property lost in Military or Naval service, or required in bankruptcy cases, or contained in applications of those who become members of or policy holders in mutual insurance companies doing business on the inter-insurance or reciprocal indemnity plan through an attorney in fact..... $ .25

Other powers of attorney not subject to tax are as follows:

(a) Warrant of attorney in a lease.
(b) Authorizing federal official to sell United States bonds in case of default.
(c) Authorizing officers of Federal Reserve Bank to assign United States bonds deposited as security.
(d) Authorizing a deputy to have access to safe.
(e) Contained in assignment for valuable consideration.
(f) Conferring no authority upon assignee not implied by the assignment.
(g) Assignment of insurance policies.
(h) To pay poll taxes.
(i) Power of sale.
(j) Authority to secretary of corporation to transfer stock.
(k) Pro forma power of attorney to transfer bonds or stock on books of corporation, printed on bond or stock certificate.
(l) Authorizing vendee of shares of stock to transfer same.
(m) Warrant of attorney in a judgment note.

Produce, Sales of, on exchange for future delivery, on each $100 in value or fraction thereof..... $ .01

So-called transferred or scratch sales are not subject to tax and this is also true of pass-outs. Sales for immediate delivery are not taxable and transfers of contracts to a clearing house for the purpose of adjusting accounts, provided no beneficial interest is passed to such clearing house, is not subject to tax.

Proxies, for election of officers or meeting for transaction of business of corporation, except for use in religious, educational, charitable, fraternal or literary societies or public cemeteries..... $ .10

Rights (See Capital Stock, Sales or Transfer)

Sales (See Capital Stock; Conveyances; Produce)

Transfers (See Capital Stock)

PENALTIES.—The law provides that whoever—

(a) Makes, signs, issues, or accepts, or causes to be made, signed, issued, or accepted, any instrument, document, or paper of any kind or description whatsoever without the full amount of tax thereon being duly paid;

(b) Manufactures or imports and sells, or offers for sale, or causes to be manufactured or imported and sold, or offered for sale, any playing cards, package, or other article without the full amount of tax being duly paid.

(c) Makes use of any adhesive stamp to denote any tax imposed by this title without cancelling or obliterating such stamps as hereinbefore outlined;

is guilty of a misdemeanor and upon conviction thereof shall pay a fine of not more than $100 for each offense.

The law also provides that whosoever

(a) Fraudulently cuts, tears, or removes from any vellum, parchment, paper, instrument, writing, package, or articles upon which any tax is imposed by this title, any adhesive stamp or the impression of any stamp, die, plate, or other article provided, made, or used in pursuance of this title;

(b) Fraudulently uses, joins, fixes, or places to, with, or upon any vellum, parchment, paper, instrument, writing, package, or article, upon which any tax is imposed by this title, (1) any adhesive stamp, or the impression of any stamp, die, plate, or other article, which has been cut, torn, or removed from any other vellum, parchment, paper, instrument, writing, package, or article, upon which any tax is imposed by this title; or (2) any adhesive stamp or the impression of any stamp, die, plate, or other article of insufficient value; or (3) any forged or counterfeited stamp, or the impression of any forged or counterfeited stamp, die, plate, or other article;

(c) Willfully removes, or alters the cancellation, or defacing marks of, or otherwise prepares, any adhesive stamp, with intent to use, or cause the same to be used, after it has been already used, or knowingly or wilifully buys, sells, offers for sale, or gives away, any such washed or restored stamp to any person for use, or knowingly uses the same;

(d) Knowingly and without lawful excuse (the burden of proof of such excuse being on the accused) has in possession any washed, restored, or altered stamp, which has been removed from any vellum, parchment, paper, instrument, writing, package, or article;

is guilty of a misdemeanor, and upon conviction shall be punished by a fine of not more than $1,000, or by imprisonment for not more than five years, or both, and any such reused, cancelled, or counterfeit stamp and the vellum, parchment, document, paper, package, or article upon which it is placed or impressed shall be forfeited to the United States.

REFUNDS.—Claims for the redemption of, or allowance for, stamps must be presented within 4 years after the purchase of such stamps from the government. Where taxes are paid pursuant to an assessment and not by the affixing of stamps, claims for refund must be presented within 4 years next after payment of such taxes.

SECTION 33

PURCHASE AND SALES TERMS

This section presents a brief description of the most generally used trade terms in American foreign and domestic business. Much of this discussion is based on the recommendations of the National Foreign Trade Council, which has issued a pamphlet on foreign trade definitions.

Shipping Quotations

NEED OF USING WELL DEFINED TERMS.—Manufacturers and exporters should make whatever quotations they employ so clear that there will be no possibility of misunderstanding or misinterpretation. Misunderstandings can best be avoided if the seller will formulate a **written statement of the general conditions** under which his sales are to be made, and will see that buyers possess these terms of sale when considering a quotation. The items which may be included in such a statement deal with: Delivery, delays, partial shipments, shipping instructions, inspection, claims, damage, and payment. If all contingencies are thus covered by carefully considered conditions of sale, disputes will largely be prevented.

The quotation "F. O. B. (named port)" as "F. O. B. New York," "F. O. B. New Orleans," "F. O. B. San Francisco," is often used by inland producers and distributors to mean merely delivery of the goods at railway terminal at the port named. This abbreviation originated as an export quotation and had no application to inland shipments. It was used only to mean delivery of the goods upon an overseas vessel at the port named. That, in fact, is the meaning universally given to the phrase among foreigners, and is the meaning which the best practice among exporters requires it invariably to have. But because of the confusion which has arisen through the use of that term with a different meaning, by inland producers and distributors, and in the interest of unmistakable clarity, American manufacturers and exporters should use the term "F. O. B. Vessel (named port)." It also avoids the difficulty which might arise among foreigners not always well versed in American geography, through confusing an inland forwarding point with a shipping port at seaboard.

CAPACITY OF BUYER TO TAKE DELIVERY.—When quoting "C. & F." or "C. I. F.", manufacturers and exporters moving large quantities of material by one vessel should be careful to ascertain in advance the buyer's capacity to take delivery. Under these terms and as a condition of making the freight rate, transportation companies may require a certain rate of discharge per day, and that rate of discharge might be in excess of the buyer's capacity to take delivery. In such event an adjustment with the transportation company would be necessary, which might affect the freight rate and consequently the price to be quoted.

EXPLANATIONS OF ABBREVIATIONS.—Following are abbreviations of shipping terms with their explanations:

F. O. B..... Free on board
F. A. S..... Free alongside
C. & F..... Cost and freight
C. I. F..... Cost, insurance and freight
L. C. L..... Less than carload lot

These definitions of export quotations are, in their order, the **normal situations** on which an export manufacturer or shipper may desire to quote prices. It is understood that unless a particular railroad is specified, the property will be delivered to the carrier most conveniently located to the shipper. If the buyer, for the purpose of delivery, or in order to obtain lower transportation charges, desires that the goods be delivered to a carrier further removed from the shipper and entailing a greater cost than delivery to the carrier most favorably situated, the carrier to which the buyer desires delivery of the goods should be named in the quotation.

F. O. B. (NAMED POINT).—When the price quoted applies only at inland shipping point and the seller merely undertakes to load the goods on or in cars or lighters furnished by the railroad company serving the industry, or most conveniently located to the industry, without other designation as to routing, the proper term is "F. O. B. (named point)." Under this quotation the **seller** must—

1. Place goods on or in cars or lighters.
2. Secure railroad bill of lading.
3. Be responsible for loss and/or damage until goods have been placed in or on cars or lighters at forwarding point, and clean bill of lading has been furnished by the railroad company.

The **buyer** must—

1. Be responsible for loss and/or damage incurred thereafter.
2. Pay all transportation charges including taxes, if any.
3. Handle all subsequent movement of the goods.

In contracts of sales F. O. B. **acceptance** takes place at the F. O. B. point. The buyer is allowed a reasonable time from that point. **Quality and quantity** are essential elements of the contract of sale. In the absence of stipulations to the contrary, the buyer's check-up on these points is of the time when they are delivered to him.

F. O. B. (NAMED POINT) FREIGHT PREPAID TO (NAMED POINT ON THE SEABOARD).—This is the proper term to use when the seller quotes a price including transportation charges to the port of exportation without assuming responsibility for the goods after obtaining a clean bill of lading at point of origin. Under this quotation the **seller** must—

1. Place goods on or in cars or lighters.
2. Secure railroad bill of lading.
3. Pay freight to named port.
4. Be responsible for loss and/or damage until goods have been placed in or on cars or lighters at forwarding point, and clean bill of lading has been furnished by the railroad company.

The **buyer** must—

1. Be responsible for loss and/or damage incurred thereafter.
2. Handle all subsequent movement of the goods.
3. Unload goods from cars.
4. Transport goods to vessels.
5. Pay all demurrage and/or storage charges.
6. Arrange for storage in warehouse or on wharf where necessary.

F. O. B. (NAMED POINT) FREIGHT ALLOWED TO (NAMED POINT ON THE SEABOARD).—This quotation should be used where the seller wishes to quote a price, from which the buyer may deduct the cost of transportation to a given point on seaboard, without seller being responsible for the goods after getting a clean bill of lading at point of origin. Under it the **seller** must—

1. Place goods on or in cars or lighters.
2. Secure railroad bill of lading.
3. Be responsible for loss and/or damage until goods have been placed in or on cars or lighters at forwarding point, and clean bill of lading has been furnished by the railroad company.

The **buyer** must—

1. Be responsible for loss and/or damage incurred thereafter.
2. Pay all transportation charges (buyer is then entitled to deduct from amount of invoice freight paid from primary point to named port).
3. Handle all subsequent movement of the goods.
4. Unload goods from cars.
5. Transport goods to vessel.
6. Pay all demurrage and/or storage charges.
7. Arrange for storage in warehouse or on wharf where necessary.

F. O. B. CARS (NAMED POINT ON SEABOARD).—This term should be used when the seller may desire to quote a price covering the transportation of the goods to seaboard, assuming responsibility for loss and/or damage up to that point. Under this quotation the **seller** must—

1. Place goods on or in cars.
2. Secure railroad bill of lading.
3. Pay all freight charges from forwarding point to port on seaboard.
4. Be responsible for loss and/or damage until goods have arrived in or on cars at the named port.

The **buyer** must—

1. Be responsible for loss and/or damage incurred thereafter.
2. Unload goods from cars.
3. Handle all subsequent movement of the goods.
4. Transport goods to vessel.
5. Pay all demurrage and/or storage charges.
6. Arrange for storage in warehouse or on wharf where necessary.

F. O. B. CARS (NAMED PORT) L. C. L.—This quotation should be used when the goods, on which a price is quoted covering transportation to the seaboard, constitutes less than a carload lot. Under it the **seller** must—

1. Deliver goods to the initial carrier.
2. Secure railroad bill of lading.
3. Pay all freight charges from forwarding point to port on seaboard.
4. Be responsible for loss and/or damage until goods have arrived on cars at the named port.

The **buyer** must—

1. Be responsible for loss and/or damage incurred thereafter.
2. Handle all subsequent movement of the goods.
3. Accept goods from the carrier.
4. Transport goods to vessel.
5. Pay all storage charges.
6. Arrange for storage in warehouse or on wharf where necessary.

F. O. B. CARS (NAMED PORT) LIGHTERAGE FREE.—This quotation should be used when the seller wishes to quote a price which will include the expense of transportation of the goods by rail to the seaboard, including lighterage. Under this term the **seller** must—

1. Place goods on or in cars.
2. Secure railroad bill of lading.
3. Pay all transportaion charges to, including lighterage at, the port named.
4. Be responsible for loss and/or damage until goods have arrived on cars at the named port.

The **buyer** must—

1. Be responsible for loss and/or damage incurred thereafter.
2. Handle all subsequent movement of the goods.
3. Take out the insurance necessary to the safety of the goods after arrival on the cars.
4. Pay the cost of hoisting goods into vessel where weight of goods is too great for ship's tackle.
5. Pay all demurrage and other charges, except lighterage charges.

The **provision of lighterage** is only within the usual free lighterage limits of the port, and where lighterage outside such limits is required, it is for buyer's account.

F. O. B. VESSEL (NAMED PORT).—This term is used when the seller desires to quote a price covering expenses up to and including delivery of the goods upon the overseas vessel at a named port. Under it the **seller** must—

1. Meet all charges incurred in placing goods actually on board the vessel.
2. Provide the usual dock or ship's receipt.
3. Be responsible for all loss and/or damage until goods have been placed on board the vessel.

The **buyer** must—

1. Be responsible for loss and/or damage thereafter.
2. Handle all subsequent movement of the goods, charter ship, or reserve space on board vessel, designate vessel or steamship line.
3. Pay all transportation charges from the named port.

While the term F. O. B. in every country, except in America, means that the seller must deliver the goods on board the vessel, it is the general practice in America to specify such an obligation by adding the word "vessel." The simple term F. O. B. has a signification in America corresponding to F. O. R. (or F. O. T.) in Great Britain and "Franco sur Wagon" in most countries on the Continent of Europe. Further, under the term, "F. O. B. Vessel"—

1. The general law of contracts in this country allows rescission (by the seller) not simply for repudiation, but also because of the inability of the other party to perform, and for any breach of contract so material and substantial that it would be a defence to an action brought by the party in default under the contract.
2. The rights of the unpaid seller with regard to stoppage of goods *in transitu* are defined in the Sales Act.
3. Quality and quantity are essential elements of the contract of sale. In the absence of stipulations to the contrary, the buyer's check-up on these points is of the time when they are delivered to him.
4. Acceptance takes place at the F. O. B. point. The buyer is allowed a reasonable time from that point.
5. Regarding refusal of payment by the buyer, consult the Sales Act.

F. A. S. VESSEL (NAMED PORT).—This quotation is used when the seller desires to quote a price covering delivery of the goods alongside overseas vessel and within reach of its loading tackle. Under it the **seller** must—

1. Transport goods to seaboard.
2. Store goods in warehouse or on wharf if necessary, unless buyer's obligation includes provision of shipping facilities.
3. Place goods alongside vessel either in a lighter or on the wharf.
4. Provide the usual dock or ship's receipt.
5. Be responsible for loss and/or damage until goods have been delivered alongside the ship or on wharf.

The **buyer** must—

1. Be responsible for loss and/or damage thereafter, and for insurance.
2. Handle all subsequent movement of the goods, charter ship or reserve space on board vessel, designate vessel or steamship line.
3. Pay cost of hoisting goods into vessel where weight of goods is too great for ship's tackle.

In selling "F. A. S. Vessel" manufacturers and exporters should be careful to have their agreements with buyers cover explicitly the question of responsibility for loss after goods have been delivered on the wharf or alongside the vessel and before they are actually loaded on the ship. There is no generally established practice on this point.

C. & F. (NAMED FOREIGN PORT).—This term is employed when the seller is ready to go farther than the delivery of his goods upon the overseas vessel and is willing to pay transportation to a foreign point of delivery. Under this quotation the **seller** must—

1. Make freight contract and pay transportation charges sufficient to carry goods to agreed destination.
2. Deliver to buyer or his agent clean bills of lading to the agreed destination.
3. Be responsible for loss and/or damage until goods have been delivered alongside the ship and clean ocean bill of lading obtained (seller is not responsible for delivery of goods at destination).

The **buyer** must—

1. Be responsible for loss and/or damage thereafter and must take out all necessary insurance.
2. Handle all subsequent movement of the goods.
3. Take delivery and pay costs of discharge, lighterage and landing at foreign port of destination in accordance with bill of lading clauses.
4. Pay foreign customs duties and wharfage charges.

C. I. F. (NAMED FOREIGN PORT).—This term is used when seller desires to quote a price covering cost of the goods, marine insurance on them, and transportation charges to foreign point of delivery. Under it the **seller** must—

1. Make freight contract and pay freight charges sufficient to carry goods to agreed destination.
2. Take out and pay for necessary marine insurance.
3. Deliver to buyer or his agent clean bills of lading to the agreed destination, and insurance policy and/or negotiable insurance certificate.
4. Be responsible for loss and/or damage until goods have been delivered alongside the ship, and clean ocean bill of lading and insurance policy and/or negotiable insurance certificate have been delivered to the

buyer, or his agent. (Seller is not responsible for the delivery of goods at destination, nor for payment by the underwriters of insurance claims.)

5. Provide war risk insurance, where necessary, for buyer's account.

The **buyer** must—

1. Be responsible for loss and/or damage thereafter, and must make all claims to which he may be entitled under the insurance directly on the underwriters.
2. Take delivery and pay costs of discharge, lighterage and landing at foreign port of destination in accordance with bill of lading clauses.
3. Pay foreign customs duties and wharfage charges.

The quotation C. I. F. signifies that:

1. If the seller has failed to insure the goods—
   (a) The buyer is entitled to take out insurance himself and to subtract the cost thereof from the amount of the invoice.
   (b) In certain cases the buyer can cancel the sale and claim damages.
2. The unpaid seller is entitled to certain remedies specified in the Sales Act.
3. Acceptance takes place at agreed destination point. The buyer is allowed a reasonable time from that point.
4. Quality and quantity are essential elements of the contract of sale. In the absence of stipulations to the contrary the buyer's check-up on these points is of the time when they are delivered to him.
5. Regarding refusal of payment by the buyer, consult the Sales Act.

Fees for consular invoices and similar items are arbitrary charges fixed by foreign governments, and are not included in the terms of C. & F. or C. I. F. quotations, and it is part of the duty of the buyer to meet them.

VARIATIONS OF ABBREVIATIONS.—There are, in more or less common use by manufacturers in different parts of the United States, numerous variations of the abbreviations, practically all of which are employed to convey meanings substantially synonymous with those defined above. For instance, there are manufacturers who quote "F. O. B. Cars," "F. O. B. Works," "F. O. B. Mill" or "F. O. B. Factory" meaning that the seller and buyer have the same responsibilities as those set forth in "F. O. B. (named point)," as "F. O. B. Detroit," "F. O. B. Pittsburgh," etc. Of the great number of abbreviations used in the United States, the form "F. O. B. (named point)" is most widely used and understood, and therefore should be adopted as the standard of practice.

AMERICAN TERMS AND FOREIGN EQUIVALENTS.—

American Term	British Term	Equivalent on Continent of Europe

TRADE TERMS IN LEADING COMMERCIAL COUNTRIES.—The International Chamber of Commerce has adopted definitions of various trade terms most generally used in the leading commercial nations and which are set forth in the following comparative digest:

"F. O. B. (named port)"—or, in United States of America, "F. O. B. vessel (named port)"

QUESTION	United States of America	Belgium	Chile	Denmark	France	Great Britain	Italy	Japan	Netherlands	Norway	Spain	Sweden
A. Must the Seller:												
1. Be responsible for and pay the transportation of the goods to the named port?	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
2. Be responsible for the loading of the goods on board the ship and cover the expenses of same?	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	*Yes* [1]	Yes	Yes	Yes
a. Are the costs of stowing also to be borne by the seller or the buyer?	Buyer	*Ship* [2]		*Buyer* [3]	*Ship* [2]	Buyer	*Note* [4]	*Ship* [3]	*Ship* [2]	*Buyer* [3]	*Ship* [2]	*Buyer* [3]
b. Are harbour dues payable by the seller or the buyer?	*Buyer* [3]	Ship		Seller	Ship	Seller	Buyer	Buyer	Ship	Ship	Ship	Seller
c. Are other ship's dues payable by the seller or the buyer?	*Buyer* [3]	Ship		*Buyer* [3]	Ship	Seller	Buyer	Buyer	*Note* [5]	Ship	Buyer	Buyer
d. Are clearance dues and other analogous dues connected with the goods payable by the seller or the buyer?	*Note* [6]	*Note* [7]		*Note* [8]	Seller	Seller	Seller	Buyer	Seller	*Note* [8]	Seller	*Note* [8]
3. Provide the usual bill of lading?	*Note* [9]	*Note* [10]	Yes	Yes	Yes	*Note* [11]	Yes	Yes	Yes	Yes	Yes	Yes
4. Be responsible for all loss and/or damage which may occur until the goods have been placed on board the vessel?	Yes	Yes	Yes	Yes	Yes	Yes	*Yes* [12]	Yes	*Yes* [1]	Yes	Yes	Yes
B. Must the Buyer:												
1. Charter a ship or reserve the necessary space on board a vessel?	Yes	Yes	Yes	*Yes* [13]	Yes	*Note* [14]	Yes	*Yes* [15]	Yes	*Yes* [16]	Yes	Yes
2. Inform the seller as to the date on which the ship will be ready, so that the seller may be in a position to load the goods within the period provided for in the contract?	Yes	Yes		Yes	Yes	*Note* [14]	*Yes* [12]	Yes	Yes	Yes	Yes	Yes
3. Be responsible for all loss and/or damage which may occur from the time that the goods are placed on board the vessel?	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	*Yes* [1]	Yes	Yes	Yes
4. Effect payment against documents (bill of lading and invoice), unless provided otherwise?		*Note* [17]		Yes	*Note* [17]	Yes	Yes	Yes		Yes	*Note* [17]	Yes

1. * * *
2. Unless otherwise provided, the costs of stowing are included in the freight.
3. Subject, however, to the practice of the port of embarkation.
4. Reference should be made to the practice of the various ports
* * *
5. In the Netherlands no general provision exists on this point.
11. The seller must declare the goods to the Customs; all dues collected up to the moment of loading on board are paid by the seller.
12. In cases of sale of a *genus* the transfer of responsibility takes place at the moment of the individualization of the goods.
13. The seller may also be required to reserve the necessary space on board a vessel.

6. * * *
7. There are no export duties.
8. Generally speaking, these dues are for seller's account if they are collected before the loading of the goods; otherwise they are for buyer's account.
9. The seller must provide the usual dock or ship's receipt.
10. The seller may, instead of the bill of lading, furnish the receipt for delivery on board or the M/R (*Mate's Receipt*). The buyer must have the bill of lading drawn up and must pay the freight, if it is payable in advance.
14. Generally speaking, the seller would reserve space on board the vessel.
15. In the case of ports which are ports of call of regular steamship lines the seller must reserve the necessary freight.
16. In the case of "parcels," it is the seller who reserves the necessary space on board the ship.
17. The buyer must pay according to the provisions of the legislation of the country.

"F. O. B. (named port)"—or, in United States of America, "F. O. B. vessel (named port)"—(Continued)

QUESTION	United States of America	Belgium	Denmark	France	Great Britain	Italy	Japan	Netherlands	Norway	Spain	Sweden
C. Does the term F. O. B. further signify that:											
1. The seller can prevent the goods from being delivered on arrival to the buyer otherwise than against payment or presentation of receipt?	*Yes* [1]		Yes		Yes	Yes	No	*Note* [2]	Yes		Yes
2. The seller can in case of non-payment, or if payment is overdue, cancel the sale?	*Yes* [1]		Yes		Yes	*Yes* [3]	Yes	*Note* [2]	Yes		Yes
3. The seller has the right to forbid delivery of the goods to the buyer if the seller has become bankrupt or suspended his payments (stoppage *in transitu*), unless the buyer has effected the payment in advance or provided sufficient guarantee?	*Yes* [1]		Yes		Yes	Yes	Yes	*Note* [2]	Yes		*Yes* [4]
4. The quality of the goods, as stipulated in the contract shall be determined according to their condition at the time of loading; unless provided otherwise, the same holds for the quantity?	*Yes* [1]		Yes	Yes	Yes	Yes	Yes	*Yes* [2]	Yes		Yes
5. The period for making claims with reference to quality or quantity commences from the day of the arrival of the goods?	*No* [5]		*Yes* [6]		Yes	Yes	Yes	*Note* [2]	Yes		Yes
6. The buyer is not entitled, on presentation of documents, to refuse payment or to refuse to accept a draft, if such mode of payment has been agreed upon, on the ground that the goods have not arrived or that he has not yet been able to examine them or even that the goods have been lost or damaged?	*Yes* [1]		Yes		Yes	Yes	Yes	Yes	Yes		Yes

1. * * *
2. * * *
3. The seller may cancel the sale or cause the goods to be sold.
4. * * *
5. The period for making claims commences from the date of loading on board.
6. The period for making claims commences from the day on which the goods are at the disposal of the buyer at the point of destination.

In Europe—"F. O. R. (named departure point)" = (Free on Rail); "F. O. T. (named departure point)" = (Free on Truck); "Franco Sur Wagon (named departure point)" In U. S. A.—"F. O. B. (named departure point inland)"

QUESTION	United States of America	Belgium	Denmark	France	Great Britain	Italy	Japan	Netherlands	Norway	Spain	Sweden
A. Must the seller:											
1. Secure railway waggon?	Yes	Yes	Yes	Yes	Yes	Yes	*Yes* [1]	*No* [2]	*No* [3]	Yes	Yes
2. Load goods on waggon within the period fixed?	*Yes* [4]	Yes	Yes	Yes	Yes	Yes	Yes	Yes	*Yes* [5]	Yes	Yes
3. Be responsible for loss and/or damage up to the time that loading is completed?	Yes	Yes	Yes	Yes	Yes	*Yes* [6]	Yes	Yes	Yes	Yes	Yes
B. Must the buyer:											
1. Be responsible for loss and/or damage incurred thereafter?	Yes	Yes	Yes	Yes	Yes	*Yes* [6]	Yes	Yes	Yes	Yes	Yes
2. Pay for transport charges from named departure point?	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
3. Unless provided otherwise, effect payment against invoice and way-bill, if, according to either of these documents the right to dispose of the goods is transferred to the buyer?	Yes		Yes		Yes	Yes	Yes		Yes		Yes
C. Does this term, further, signify that:											
1. As the buyer is not bound to examine the goods before they are placed at his disposal at the destination point, the period for making a claim with reference to quality or quantity only commences then? (Nevertheless, this provision can be modified by agreement between the two parties or by commercial custom.)	*No* [7]		Yes	Yes	Yes	Yes	Yes	*Note* [8]	Yes		Yes
2. The quality of the goods as stipulated in the contract must be determined according to their condition at the time when the loading on waggon is finished; same provision holds as regards quantity?	Yes		Yes	Yes	Yes	Yes	Yes	Yes	Yes		Yes
3. The seller has the right to forbid delivery of the goods to the buyer if the buyer has become bankrupt or suspended his payments (stoppage *in transitu*)?	*Yes* [7]		Yes		*Note* [9]	Yes	Yes	*Note* [8]	Yes		Yes

1. Yes, in cases where there is a regular service of trains.
2. The buyer must procure a waggon.
3. The seller must *order* a waggon for buyer's account.
4. Nothing is laid down with regard to the period for making claims.
5. But the seller is not responsible in cases where he cannot procure a waggon within the stipulated period; in such cases the buyer is not entitled to cancel the order.
6. In cases of sale of a *genus* the transfer of the responsibility takes place at the moment of the individualization of the goods.
7. * * *
8. * * *
9. When the seller has once placed the goods at the disposal of the buyer, so that the buyer has control of them, the title to the goods has passed to buyer; and in consequence the goods cannot be recovered by the seller (even if the goods have been lost or delayed in transit). The goods then become the property of the Receiver in bankruptcy.

N. B.—In Italy and Scandinavian countries, this clause is practically only used where consignments in complete waggons are concerned. Where parcels are concerned, the signification of the clause is the same excepting that the seller is not bound to secure a waggon or to load the goods. He simply hands over the goods to the railway company and the buyer thereby becomes responsible for them. In this case, the seller frequently uses the "term at the buyer's risk."

"Free Delivered (named destination point)"—"Franco Rendu (named destination point)"

QUESTION	United States of America (*see Note* 1)	Belgium	Denmark	France	Great Britain	Italy	Japan	Netherlands (*see Note* 2)	Norway	Spain	Sweden
A. Must the seller:											
1. Be responsible for the despatch of the goods to agreed destination and pay all charges?		Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	*Note* 3	Yes
2. Deliver the goods or hold them at the disposal of the buyer at the destination point within the time stipulated in the contract?		Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
3. Be responsible for loss and/or damage up to the time when the goods are delivered to the buyer through the transporting company?		Yes	Yes	Yes	Yes	*Yes* 4	Yes	Yes	Yes	Yes	Yes
B. Must the buyer:											
1. Be responsible for loss and/or damage incurred thereafter?		Yes	Yes	Yes	Yes	*Yes* 4	Yes	Yes	Yes	Yes	Yes
2. Pay the transport charges not paid by the seller the said charges being subsequently deducted from the amount of the invoice?			Yes	No	No	Yes	Yes	*Note* 5	No	Yes	Yes
3. Pay the unloading charges?		Yes		No	*Note* 6	Yes	Yes	Yes	No	Yes	Yes
4. Pay all import and entrance duties?			*Note* 7	*Note* 8	Yes	Yes	Yes	*Note* 9	Yes	*Note* 10	*Yes* 11
C. Does this term, further, signify that:											
1. The quality of the goods as stipulated in the contract must be judged according to their state at the time of arrival; the same provision holds as regards quantity?			Yes	Yes	Yes	*Yes* 12	Yes	Yes	Yes		Yes
2. Unless provided otherwise, the buyer is not bound to pay for the goods against the bill of lading or way-bill, but payment for same can only be demanded against delivery of the goods?			Yes		No	Yes	Yes	*Note* 13	Yes		Yes
3. The seller has a right to forbid delivery of the goods to the buyer if the buyer has become bankrupt or suspended his payments (stoppage *in transitu*)?			Yes		*Note* 14	Yes	Yes	*Note* 13	Yes		Yes

1. This term is not currently used in the United States.
2. The Dutch term is "Free on truck (or ship) delivered (named destination point)."
3. The seller has the option of insuring the goods or not, and of undertaking the risk of despatch.
4. In cases of sale of a *genus* the transfer of the responsibility takes place at the moment of the individualization of the goods.
5. There is no general rule.
6. This is entirely a matter of arrangement.
7. There is no rule; generally speaking Customs dues are considered as being for buyer's account.
8. The seller must pay national import duties and the buyer the local duties.
9. The buyer must pay import duties payable after the completion of transportation.
10. In order to ensure that the seller is obliged to undertake payment of Customs dues, the word "dédouané" (passed through Customs) should be added.
11. * * *
12. * * *
13. * * *
14. The seller has the right to withold the delivery of the goods as long as the bill of lading or way-bill has not passed into the possession of the buyer.

C. I. F. or C. A. F. (cost, insurance, freight)

QUESTION	United States of America	Belgium	Chile	Denmark	France	Great Britain	Italy	Japan	Netherlands	Norway	Spain	Sweden
A. Must the seller:												
1. Ship the goods at his own expense to agreed destination point?	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
2. Pay export and exit duties and all other duties of the same kind at the port of embarkation and during the voyage?	*Note* [1]	Yes		Yes	Yes	Yes	Yes	Yes	Yes	*Note* [2]	*Note* [3]	Yes
3. Take out and pay all necessary and usual marine insurance?	*Yes* [4]	*Yes* [4]	*Yes* [4]	*Yes* [4]	*Yes* [4]	*Yes* [4]	*Yes* [4]	*Yes* [4]	*Yes* [4]	*Yes* [4]	*Yes* [4]	*Yes* [4]
4. Hand over to the buyer or to any of his representatives, a clean bill of lading for agreed destination, a marine insurance policy, a negotiable insurance certificate, and a certificate of origin if the Customs regulations of the receiving country require it?	*Yes* [5]	Yes	Yes	Yes	Yes	*Yes* [6]	Yes	Yes	Yes	Yes	Yes	Yes
5. Be responsible for loss and/or damage, up to the time the goods are loaded on board the vessel?	*Note* [7]	Yes	Yes	*Note* [8]	Yes	*Note* [9]	*Yes* [10]	Yes	Yes	*Note* [8]	Yes	*Note* [8]
B. Must the buyer:												
1. Be responsible for loss and/or damage incurred thereafter (the buyer is responsible for making all claims before the underwriter or underwriters)?	Yes	Yes	*Yes* [11]	Yes	Yes	Yes	*Yes* [10]	Yes	Yes	Yes	Yes	Yes
2. Take delivery of the goods and pay the charges for unloading, lighterage and landing at port, in accordance with the bill of lading clauses?	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
3. Pay all foreign import taxes, customs duties and wharfage charges?	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
4. Unless provided otherwise, make the payment against bill of lading, insurance policy and invoice?		*Note* [12]		Yes	*Note* [12]	Yes	Yes	Yes	Yes	Yes		Yes
5. Pay the freight not paid by the seller, the said freight being subsequently deducted from the amount of the invoice? (This obligation falls upon the buyer even if the payment is due only at a future date. The buyer is not entitled to any interest on such a payment.)	Yes	*Yes* [11]		Yes		No	Yes	Yes	Yes	Yes		Yes

1. There are no export duties in the United States. Consequently there is no general practice on this point. However consular fees and other special dues are considered as being for buyer's account.
2. The seller must pay export and similar duties if they are collected *before* loading; but not otherwise.
3. * * *
4. * * *
5. However it is taken for granted that the seller will take reasonable care to provide, *at buyer's expense*, consular invoice and certificates of origin and such other foreign government requirements as are specifically covered in instructions from the buyer.
6. No general provision exists as regards certificate of origin.
7. The seller is responsible up to the point the goods are delivered alongside ship.
8. The seller is responsible until the completion up to the despatch of the goods.
9. The seller is responsible up to the handing of the goods over to the care of the shipowner.
10. In cases of sale of a *genus* the transfer of the responsibility takes place at the moment of the individualization of the goods.
11. If required the seller should assist the buyer in making claim.
12. The buyer must pay according to the provisions of the legislation of the country.
13. Provided that this freight has been deducted from the total of the invoice.

C. I. F. or C. A. F. (cost, insurance, freight)—(Continued)

QUESTION	United States of America	Belgium	Chile	Denmark	France	Great Britain	Italy	Japan	Netherlands	Norway	Spain	Sweden
C. Does the term C.I.F. further signify that:												
1. If the seller has failed to insure the goods:												
a. The buyer is entitled to damages for any prejudice caused him by this fact?	Yes	Yes		Yes	Yes	*Note* [1]	Yes	Yes	*Note* [2]	Yes	Yes	Yes
b. The buyer is entitled to take out insurance himself and to subtract the cost thereof from the amount of the invoice?	Yes	Yes		Yes	Yes	*Note* [1]	Yes	Yes	*Note* [2]	Yes	Yes	Yes
c. In certain cases, the buyer can cancel the sale and claim damages?	Yes			Yes	Yes	*Note* [1]	Yes	Yes	*Note* [2]	Yes	Yes	Yes
2. The seller is entitled to:												
a. Prevent the goods on arrival from being delivered to the buyer except against payment?	*Note* [3]			Yes		*Yes* [4]	Yes	Yes	*Note* [2]	Yes		Yes
b. Cancel the sale and claim damages in case of non-payment or if the payment is overdue?	*Note* [3]			Yes		*Yes* [4]	Yes	Yes	*Note* [2]	Yes		Yes
c. Prevent the goods from being delivered to the buyer if the buyer has become bankrupt or has suspended his payments (stoppage *in transitu*)?	*Note* [3]			Yes		*Yes* [4]	Yes	Yes	*Note* [2]	Yes		Yes

C. I. F. or C. A. F. (cost, insurance, freight)—(Continued)

QUESTION	United States of America	Belgium	Chile	Denmark	France	Great Britain	Italy	Japan	Netherlands	Norway	Spain	Sweden
C—(Continued)												
3. As the buyer is not bound to examine the goods before their arrival at destination point the period for making claims with reference to quality and quantity commences then?	Yes			Yes	Yes	*Yes* [5]	Yes	Yes	*Note* [2]	Yes		Yes
4. The quality of goods as stipulated in the contract must be determined according to their condition at the time of loading, unless provided otherwise; (the same provision holds good as regards the quantity)?	Yes	Yes		Yes	Yes	*Note* [6]	Yes	Yes	*Note* [2]	Yes		Yes
5. When goods have been sold C. I. F. the provision regarding the time for delivery in the contract, unless provided otherwise, refers to the date of despatch of the goods and not to that of their arrival?	*Note* [3]	Yes		Yes	Yes	Yes	Yes	Yes	*Note* [2]	Yes	Yes	Yes
6. Upon presentation of the documents the buyer is not entitled to refuse payment or to refuse to accept a bill, if this mode of payment has been agreed to, on the ground that the goods have not yet arrived or that he has not been able to examine them or even that the goods are lost or damaged?	*Yes* [3]	*Yes* [7]		Yes		Yes	Yes	Yes	*Note* [2]	Yes	Yes	Yes

1. The seller must comply with the *Sales of Goods Act*, Section 32 (3).
2. * * *
3. * * *
4. Provided that the bill of lading has not already been handed over to the buyer or his agent.
5. Provided no agreement has been made to examine the goods before despatch.
6. There will be no inspection unless specially stipulated for in the contract.
7. Provided that the "date of despatch" means the date of loading on board the ship, and provided also that the seller has taken the usual precautions in the choice of the ship.

Trade Discounts and Terms of Payment

TRADE DISCOUNTS.—Because of changing market prices trade discounts are given on **"list" (base) prices,** thereby avoiding a frequent revision and publication of catalogs, etc. As the market price decreases the trade discount is increased, and vice versa. The discount terms, which are written on the invoices, may be a single discount (as, less 25%) or a series of discounts sometimes called **"chain" discounts,** as, less 20%, 10% and 5%.

Example: A list price of $800 with discount of 20%, 10% and 5%.

List price	$800.00
Less 20% of $800	160.00
	$640.00
Less 10% of $640	64.00
	$576.00
Less 5% of $576	28.80
Sales price	$547.20

A series of discounts are equal to a certain single discount, e.g.:

List price	100.0%	
20% of 100	20.0	20.0%
	80.0%	
10% of 80	8.0	8.0
	72.0%	
5% of 72	3.6	3.6
	68.4%	31.6%

20%, 10% and 5% = 31.6%
31.6% of $800.00 = $252.80 discount
$800.00—$252.80 = $547.20 sales price
or 68.4% of $800.00 = $547.20 sales price

TERMS OF PAYMENT.—To suit the activity of the various commodities and other modifying circumstances attending the different lines of trade there have arisen several terms of payment.

C. B. D.—Cash Before Delivery.—When the seller does not wish to take any credit risk and will not assume the risk of having the buyer refuse the goods after they have been shipped, he sells on these terms.

C. O. D.—Cash on Delivery.—The seller who wants to avoid a credit risk sells C. O. D. Sometimes he requires a **deposit** to cover any probable losses of transportation, handling expenses, damages and deterioration should the buyer not accept the goods upon arrival.

R. O. G.—Receipt of Goods.—The time consumed in transportation varies greatly between nearby and distant buyers, particularly in certain trades. In order to equalize their terms of payment sometimes the seller makes the time allowed for taking discount begin at the time the goods are received by the buyer.

Instalment Plan.—Certain slow-moving and high-priced goods, such as furniture, books and agricultural machinery, are sold on the instalment plan. The **title** remains with the seller until the last instalment is paid. Bankers are wary of financing a seller on this plan because of so many defaults of payment and goods returned.

Season Dating.—In many lines of seasonal business the seller may date the purchase order several months ahead or allow a considerable amount of time to elapse before the beginning of the discount period. This is to induce the buyer to place his order ahead and let it be shipped out, thereby relieving the rush period, and gaining advance information as to quantity of importation or manufacture.

Cash Discounts.—The following are typical terms of cash discount:

1% 10d.—1% discount if paid in 10 days.
Net 30d.—Pay net within 30 days.
2% 10th proximo—2% discount if paid by the 10th of the following month.
5% e.o.m.—5% discount if paid by the end of the month.
60d. extra—Amounts to **dating** the bill 60 days ahead, e.g.: A bill dated June 1 is due or the discount period begins August 1.

There may be a combination of some of the above terms as:

2% 10d. net 60d.—2% if paid in 10 days or net if paid from 11 to 60 days.
1% 10d. net 30d. 60d. extra—1% if paid between the 60th and 70th day after date of bill, net if paid from the 71st to the 100th day, and if paid prior to the 60th day, deduct 1% and interest on the net amount from the time of payment to the 60th day.

When bills are paid after the discount period the buyer loses the discount in theory, but in practice it is not always true. Sometimes the discount is allowed but interest is charged at 6% for the time overdue. Some houses require the buyer to lose 1% discount for each month overdue. Where extra terms are given, the seller usually allows 8% deducted from the gross amount if paid within 10 days from date.

TERMS OF SALE OF VARIOUS TRADES.—The terms of cash discount allowed in various trades are set forth in the accompanying tabulation which appears in the Credit Men's Diary and Manual of Commercial Laws for 1924, published by the National Association of Credit Men, and which was prepared from material compiled by W. H. Steiner of the Statistical Department of the Federal Reserve Board.

Terms of Sale

(When commodities appear in more than one column, numbers in parentheses are added. Thus, for example, zinc appears in column 1 with the notation (2) after it, showing that it also appears in column 2.)

½% 10d.	½% 10d. Net 30d.	1% 10d.	1% 10d. Net 30d.	1% 10d. Net 30d. (Cont.)	1% 10d. Net 60d.	1% 10d. 60d. Extra	1% 15d. Net 30d.
1	2	3	4	4a	5	6	7
1. Bacon (2) 2. Hams (2) 3. Zinc (high grade) (usual terms) (2)	1. Anthracite Coal (certain cases) 2. Bacon (1) 3. Bars (sheet) 4. Coffee (green) (small jobbers) (14) (16) 5. Ham (1) 6. Ingots 7. Rails (light) 8. Rivets (½" and larger) 9. Rods (wire) 10. Spices (4a) (14a) (whole) 11. Zinc (high-grade) (terms for purchasers of high standing) (1)	1. Brick (face) (11) (41) 2. China 3. Gasoline 4. Glove Leather (12) (14) (24) (26) (28) (31) (33) 5. Hosiery (general) (12) (13) (15) (16) (33) (43) 6. Kerosene (Mid. Atl. States) 7. Lumber (11) (18) (20) 8. Overalls (11) 9. Pottery (12a) 10. Shirts (working) (11) (15) 11. Shoes (New England) (12a) (14a) (24) (33) 12. Spools 13. Yarn (10) (11)	1. Bolts, rivets, nuts (less than ½") 2. Bottles 3. Boxes 4. Brass, copper, rods, wire sheeting, tubing 5. Chemicals and drugs (medical and technical) (5) (8) (14) (23) (11) 6. Cigars (imported) (5) 7. Drugs (crude) (same as 5) 8. Flour (used in rare cases) (10) 9. Glass (plate, window) (7) (8) 10. Groceries (gen. items) (whole.) (5)	11. Ketchup, etc. (12) 12. Lead (chemical sheet) 13. Lead pipe (chemical) 14. Oils (5) (12) 15. Paints (14a) (12a) 16. Peanut butter 17. Preserves (5) (9) 18. Sauces (9) (12a) 19. Shipping containers (shooks) (14) 20. Spices (2) (14a) 21. Underwear (knit) (whole. and retail) (5) (6) (15) (16) (18) (48) (51) 22. Varnishes (14a)	1. Cigars (domestic) (4) 2. Drugs and chemicals (4) (8) (11) (14) (23) 3. Groceries (canned gds.) (4) 4. Medicine (all mixed orders) 5. Oils (branded) (carload or less) (4a) (12) 6. Preserves (4a) (9) 7. Soups (canned) (9) 8. Underwear (heavy-weight.) SECTION 34

ABBREVIATIONS OF BUSINESS TERMS

The use of abbreviations in commercial transactions, although not recommended, is nevertheless customary and will continue, in all probability, for some time.

In preparing the following tabulation the most authoritative sources were consulted with a view to including only accepted abbreviations in general use. In correct usage many abbreviations are capitalized and others are not. In some instances there is no standardized form. As a rule the abbreviations in this list are presented in the form generally followed in trade.

A

A.	"Assented" (N. Y. Stock Exchange ticker), Class A
a.	Acre, are, answer
&	And
&c.	And the rest, and so on
@, a	At, to, from
A. & F.	August and February
A. & O.	April and October
a.a.r.	Against all risks
ab., abt.	About
a/c	Account current, account
acc.	Acceptance
acct., a/c.	Account
A/D	After date
A. D.	*Anno Domini* (L., in the year of our Lord)
admr.	Administrator
admrx., admx.	Administratrix
adv.	Advice
adv., advt.	Advertisement
afft.	Affidavit
a.g.b.	Any good brand
A. G. F. A.	Assistant general freight agent
agst.	Against
Agt., agt.	Agreement, agent, against
A. H.	After hatch
aj.	Adjustment
Al	First class
Am.	American
A. M., a.m.	*Ante Meridiem* (L., before noon)
amp.	Ampere
amp-hr.	Ampere-hours
amt.	Amount
Ans., ans.	Answer, answered
a/o	Account of
APD	Assessment paid (N. Y. Stock Exchange ticker)
approx.	Approximately
A/R	All risks
arr.	Arrived, arrivals
Art., art.	Article
A/S	After sight
a/s	Account sales
assigt.	Assignment
assmt.	Assessment
assn., assoc.	Association
Asst.	Assistant
A/T	American terms (grain trade)
ats.	At the suit of (law)
A. to O. C.	Attached to other correspondence
att., atty.	Attorney
av.	Average
avoir., avdp.	Avoirdupois

B

B.	Bid, bonds, buyer, class B
B/–	Bag, bale
bal.	Balance
B. B.	Branch bill, bill book
bbl.	Barrel
B/C	Bill for collection
B/D	Bill discounted, bar draft
B/d	Brought down
bd.	Bond, bound

bd. ft.	Board feet (or foot)
bdl.	Bundle
bdls.	Bundles
bds.	Boards
B/E	Bill of exchange
bet.	Between
B/F	Brought forward
bg.	Bag
bk.	Bank, book, bark
B/L, b.l.	Bill of lading
bl.	Bale, barrel
blk.	Black, bulk
B. N.	Bank note
BNK	Bank (N. Y. Stock Exchange ticker)
B. O., b.o.	Branch office, buyers' option
B/o	Brought over
bot.	Bought, bottle
B/P	Bills payable
B. P. B.	Bank post bill
Br., Brit.	British
B/R	Bills receivable
B/S	Bill of sale
B/s	Bags, bales
Bs/L	Bills of lading
B. T. U.	Board of trade unit, British thermal unit
bu.	Bushel
B. V.	Book value
bx.	Box
bxs.	Boxes

C

C.	Class C, coupon, cash, centigrade, county
c.	Carat (metric unit), *centum* (L., hundred)
c., cts.,	Cents
ca.	Centare (metric unit)
C. A.	Credit account, chartered accountant
C/A	Capital account
cap.	Capital
cart.	Cartage
cash.	Cashier
C. B.	Cash book, county bill
C. B. D.	Cash before delivery
C. C.	Country check, country clearing, cash credit
C. D., c.d.	*Cum* dividends (L., with dividends), commercial dock
C/d	Carried down
C. E.	Civil engineer
cent.	Centigrade
cent., Ct., ct.	*Centum* (L., a hundred)
cert., certif.	Certificate
cf.	Compare
C/f	Carried forward
C. & F.	Cost and freight
c.f.o.	Coast for orders
cg.	Centigram
cge. pd.	Carriage paid
C. G. S., c.g.s.	Centimeter-gram-second
CH	Custom-house; clearing house (N. Y. Stock Exchange ticker)
ch.	Chain
chem.	Chemist, chemistry
chgd.	Charged
chq.	Check
C. I. F.	Cost, insurance and freight
C. I. F. & C.	Cost, insurance, freight and commission
C. I. F. & E.	Cost, insurance, freight and exchange
C. I. F. C. & I.	Cost, insurance, freight, commission and interest
C. I. F. I. & E.	Cost, insurance, freight, interest and exchange
ck.	Cask, check
cks.	Casks, checks
C. L.	Carload
cl.	Centiliter
cld.	Cleared
clk.	Clerk
CLT	Collateral trust (N. Y. Stock Exchange ticker)
cm.	Centimeter
cm.^{2}	Square centimeters
cm.^{3}	Cubic centimeters
cml.	Commercial
CN	Consolidated or consols (N. Y. Stock Exchange ticker)
C/N	Credit note, circular note
C/O	Cash order
Co.	Company, country, county
c/o, c.o.	Carried over, care of
C. O. D.	Cash (or collect) on delivery
coll.	Collector, college, collateral
collr.	Collector
Com., com.	Commission, commissioner
Con., con.	Consolidated, consul
Cons., cons.	Constitution, consolidated
Cont., cont.	Contract, continued
contg.	Containing
contr.	Contract
Conv., conv.	Convertible
Copt., C.	Copyright
corp.	Corporation
corr., corresp.	Correspondence
C/P	Charter party

Cp., cp.	Compare
c/p	Custom of port (grain trade)
C. P. A.	Certified public accountant
C/R	Company's risk
Cr., cr.	Credit, creditor
Cr. 8vo.	Crown octavo—book size
Cor. Sec.	Corresponding secretary
Crs., crs.	Credits, creditors
C/S	Colliery screened (coal trade)
C/s, Cs, cs.	Cases
CT	Certificates (N. Y. Stock Exchange ticker)
C/T	California terms (grain trade)
C. T.	Cable transfer
c.t.	Commercial traveler
ctge.	Cartage
cts.	Cents
cu., cub.	Cubic
cu. ft.	Cubic feet
cu. in.	Cubic inches
cu. yd.	Cubic yard
cum. D., cum. div.	Cumulative dividend, with dividend
Cum. pref.	Cumulative preferred
curr.	Current—of the present month
CV	Convertible (N. Y. Stock Exchange ticker)
c.w.o.	Cash with order
cwt.	Hundredweight
Cy.	Currency (N. Y. Stock Exchange ticker)

D

d	*Denarius* (L., a penny)
D.	Deeds
D. & w.t.f., dwtf	Daily and weekly till forbidden
D/A	Deposit account, discharge afloat, deed of arrangement
d/a	Days after acceptance
D. A.	Documents against acceptance, documentary bill for acceptance
D. B., d.b.	Day book
dbk.	Drawback
D/D	Demand draft
D/d	Days after date
d/s, Dd/s	Delivered sound (grain trade)
Deb., deb.	Debenture
Dec., dec.	Decrease, December, deceased
def.	Deferred, defendant
deg., °	Degree (as, 30°—thirty degrees)
deld.	Delivered
dept., dpt.	Department
dft.	Draft, defendant
dg.	Decigram
diam.	Diameter
dict.	Dictionary
diff.	Difference
dim.	Diminutive
dis., disct.	Discount
dist.	District, discount
div.	Dividend
dk.	Dock, deck
dkg.	Decagram
dkl.	Decaliter
dkm.	Decameter
dkm.^{2}	Square decameter
dks.	Decastere
dl.	Deciliter
D. L. O.	Dead letter office
dm.	Decimeter
dm.^{2}	Square decimeter
dm.^{3}	Cubic decimeter
D. M. J. S.	December—March—June—September
D/N	Debit note
D/O, D. O.	Delivery order
Do., do.	Ditto—the same
doc.	Document
dol.	Dollar
dols.	Dollars
doz.	Dozen, dozens
D. P., D/P	Document against payment
D. R., d. r.	Deposit receipt (banking)
Dr., dr.	Debit, debtor, doctor, drachma, dram
dr. ap., ℥	Dram, apothecaries'
dr. av.	Dram, avoirdupois
Drs., drs.	Debtors
D/S, d/s, d.s.	Days after sight
ds.	Decistere
D/W	Dock warrant
d.w.	Dead weight
dwt.	Pennyweight (24 grains)
D/y	Delivery
dy.	Penny (as 10 dy. nails)

E

E.	East, eastern
ea.	Each
E. D.	Ex dividend
Ed., ed.	Editor, edition
Eds., eds.	Editors
E. E.	Errors excepted
E. & O. E	Errors and omissions excepted

e.g.	*Exempli gratia* (L., for example)
E/I	Endorsement irregular
Enc., encl.	Enclosure, enclosed
end.	Endorsed
Eng.	English
entd.	Entered
e.o.m.	End of the month
e.r.	En route (on the way)
est.	Estate, estimated, established
estab.	Established
et. al.	And others, and elsewhere
etc.	*Et cetera* (L., and so on, and so forth)
et. seq.	*Et sequentia* (L., and the following, and what follows)
Ex., ex.	Example, exchange
Ex	Without (as, ex-coupon)
ex cp.	Ex-coupon
ex D., ex div.	Ex-dividend
exd.	Examined
ex int.	Ex interest
exch.	Exchange
exct., exec., exor., extr.	Executor
execx., extrx.	Executrix
exp.	Expense, express, export
ex-rights	Not including rights
ex-ships	Delivered out of ships
EXT	Extended, extension (N. Y. Stock Exchange ticker)

F

F	Franc, Fahrenheit, French
f.a.a.	Free of all average (marine insurance)
F. & A.	February and August
f.a.q.	Fair average quality
f.a.q.s.	Fair average quality of season
f.a.s.	Free along ship, free alongside
fath.	Fathom
fcp.	Foolscrap
f.c.s. or f.c. & s.	Free of capture and seizure
F/d	Free docks
FD	Funding (bonds) (N. Y. Stock Exchange ticker)
Fed. Res. Bd.	Federal Reserve Board
Fed. Res. Bk.	Federal Reserve Bank
ff.	Following
f.f.a.	Free from alongside, free foreign agency
f.g.a.	Foreign general average, free of general average
f.g.f.	Fully good, fair
F. H., f.h.	Fore hatch
f.i.b.	Free into bunker (coal trade)
fig.	Figure
fir.	Firkin
f.i.t.	Free of income tax, free in truck
Fl., fl.	Florin
fl. dr.	Fluid dram
fl. oz.	Fluid ounce
FLT	Flat, that is, without interest (N. Y. Stock Exchange ticker)
F. M. A. N.	February—May—August —November
Fo., fo., fol.	Folio
F/o	For orders, full out terms
F. O., f.o.	Firm offer, free overside
F. O. B., f.o.b.	Free on board
f.o.c.	Free of charge
fol., foll., folg.	Following
for.	Foreign, forward
f.o.r.	Free on rails at point of dispatch
f.o.t.	Free on trucks
f.o.w.	First open water
F. P.	Fire policy
f.p.	Fully paid, foot-pound
F. P. A., f.p.a.	Free of particular average
F. Pd.	Full paid
Fr., fr.	French and franc
frs.	Francs
frt., fgt.	Freight
ft., (′)	Foot, feet (as, 1′ 4″—one foot four inches)
fthm., fth.	Fathom
ft. lb.	Foot-pounds
f'ture	Furniture
F. T. W.	Free trade wharf
f. up	Follow up
fur.	Furlong
fut.	Future
fwd.	Forward

G

G.	Gold, Guarantee
g.	Gram
G/a, g. a.	General average (marine insurance)
G. A.	General agent, general average
gal.	Gallon
gaz.	Gazette
G. B.	Great Britain
GB	Gold bonds (N. Y. Stock Exchange ticker)

g.b.o.	Goods in bad order
G. C. A.	General claim agent
g.c.m.	Greatest common measure
Gen., gen., gen'l.	General
gent.	Gentleman
gentn., gents	Gentlemen
G. F. A.	General freight agent
g. gr., gr. gro.	Great gross (144 doz.)
gi.	Gill
GM	General mortgage (N. Y. Stock Exchange ticker)
G. M. B., g.m.b.	Good merchantable brand
g.m.q.	Good merchantable quality
GNT	Grant (land) (N. Y. Stock Exchange ticker)
G. O. B., g.o.b.	Good ordinary bonds or brand
Gov.	Governor
govt.	Government
G. P. A.	General passenger agent
G. P. O.	General post office
Gr., gr.	Gross, grain
gr. wt.	Gross weight
gs.	Guineas
G. T. C.	Good till canceled
GTD	Guaranteed (N. Y. Stock Exchange ticker)
G. T. M.	Good this month
G. T. W.	Good this week: becomes void on Saturday
guar.	Guaranteed

H

ha.	Hectare
hab. corp.	*Habeas corpus*, (L., produce the body)
h.e.	*Hoc est* (L., that is); *hic est* (L., this is)
hf.	Half
hf. bd.	Half-bound
H. F. M.	Hold for money
hg.	Hectogram
hhd.	Hogshead
hl.	Hectoliter
hm.	Hectometer
$hm.^2$	Square hectometer
$hm.^3$	Cubic hectometer
H. O.	Head office
H. P., h.p.	Horse-power
H. P. N., h.p.n.	Horse-power nominal
hr.	Hour
ht.	Height
hund.	Hundred

I

per ct., per cent (%)	*Per centum* (L., by the hundred)
per. pro.	Per procuration (by agency)
pf., pfd.	Preferred
P. I.	Philippine Islands
pk.	Peck
pkg.	Package
pl.	Plural, place
plf., plff., pltff.	Plaintiff
P. M., p.m.	Postmaster, *post meridiem* (L., afternoon)
pm.	Premium

P. M. G.	Postmaster general
P/N or p.n.	Promissory note
P. O.	Postal order, post office
P. O. B.	Post office box
P. O. D.	Pay on delivery, post office department
P. O. O.	Post office order
pop.	Population
pp.	Pages
P.p.	*Per procurationem* (L., by procuration), picked ports, parcel post, partly paid
p.p.i.	Policy proof of interest (marine insurance)
PR	Preferred (N. Y. Stock Exchange ticker)
pr.	Pair, per, price
pref.	Preference or preferred
pres.	Present
Pres.	President
prin.	Principal
pro.	*Pro forma* (L., as a matter of form)
proc.	Proceedings
pro tem	*Pro tempore* (L., for the time being)
prox.	*Proximo* (L., of the next month, next)
Prs.	Printers
prs.	Pairs
P/S, P. S.	*Post scriptum*, (L., postscript), public sale
P. T., p.t.	Paying teller, post-town, private terms
Pt., pt.	Pint, part, payment; platimum (capital letter), point, port.
P. T. O., p.t.o.	Please turn over (a page or leaf)
pts.	Pints
#	Pound
pub.	Publisher, public
pub. doc.	Public document
pwt.	Pennyweight
P. X.	Please exchange

Q

Q., q.	Query or question
q.c.	Which is
qlty.	Quality
qr.	Quarter, farthing, quire
qrs.	Quarters
qt.	Quart
qts.	Quarts
quad.	Quadrant
quan.	Quantity
q.v.	*Quod vide* (L., which see)
qu., qy.	Question, query

R

R.	Rupee, registered
R/A	Refer to acceptor
R/D	Refer to drawer
rd.	Round, road, rod
R. D. C.	Running down clause (marine insurance)
re	In regard to, relating to
R. E.	Real estate
recd.	Received
recr.	Receiver
Rec. Sec.	Recording secretary
rect, rc'p't, rec't	Receipt
ref.	Reference
reg., regd.	Registered
rep., Rep.	Representative
retd.	Returned
Rev. a/c	Revenue account
R. F. D.	Rural free delivery
rm	Ream
R. O. G.	Receipt of goods (time allowed for taking discount is measured from time goods are received by purchaser)
r.o.p.	Run of paper
R/p	Return of post
R. P.	Reply paid
R. R.	Railroad
rs.	Rupees
R. S. V. P.	*Respondez s'il vous plaît* (F., reply if you please)
rt.	Right
RTS	Rights (N. Y. Stock Exchange ticker)
Ry. or Rw.	Railway

S

S	Silver
s.	Stere
$	Dollars
$g	Gold dollar
$ Mex.	Mexican dollar
s.a.	Subject to approval
S. A.	South America
S. & M.	September and March
S. A. P.	Soon as possible
s. ap., ℈	Scruple, apothecaries'
S. B.	Short bill, sales book
s.c.	Sharp (i.e., prompt) cash, small capitals
SC	Scrip (N. Y. Stock Exchange ticker)
S. C.	Safe custody
sch., schr.	Schooner
scp.	Script
S/D	Sea damaged (grain trade)
